# Table of Content

Table of Content ..... 2
Figure Index ..... 8
Table Index ..... 12
Warranty Disclaimer ..... 15
Chapter 1 System Overview ..... 16
1.1 Address Mapping ..... 16
1.2 System Boot ..... 20
1.3 System Interrupt Connection ..... 20
1.4 System DMA Hardware Request Connection ..... 27
Chapter 2 CRU ..... 29
2.1 Overview ..... 29
2.2 Block Diagram ..... 29
2.3 Function Description ..... 30
2.4 CRU Register Description ..... 33
2.5 DDR0CRU Register Description ..... 259
2.6 DDR1CRU Register Description ..... 265
2.7 DDR2CRU Register Description ..... 272
2.8 DDR3CRU Register Description ..... 278
2.9 BIGCORE0CRU Register Description ..... 284
2.10 BIGCORE1CRU Register Description ..... 292
2.11 DSUCRU Register Description ..... 300
2.12 PHPTOPCRU Register Description ..... 319
2.13 SBUSCRU Register Description ..... 323
2.14 SECURECRU Register Description ..... 328
2.15 PMU1CRU Register Description ..... 341
2.16 PMU1SCRU Register Description ..... 355
2.17 Application Notes ..... 358
Chapter 3 CPU ..... 362
3.1 Overview ..... 362
3.2 Block Diagram ..... 362
3.3 Function Description ..... 363
Chapter 4 Graphics Process Unit (GPU) ..... 364
4.1 Overview ..... 364
4.2 Block Diagram ..... 365
4.3 Function Description ..... 365
4.4 Register Description ..... 365
4.5 Interface Description ..... 365
4.6 Application Notes ..... 366
Chapter 5 VPU ..... 367
5.1 Overview ..... 367
5.2 Block Diagram ..... 368
5.3 Video frame format ..... 369
5.4 Function Description ..... 372
5.5 Register Description ..... 385
5.6 Application Notes ..... 674
Chapter 6 General Register Files (GRF) ..... 685
6.1 Overview ..... 685
6.2 Function Description ..... 685
6.3 PMU0_GRF Register Description ..... 686
6.4 PMU1_GRF Register Description ..... 691
6.5 SYS_GRF Register Description ..... 707
6.6 BIGCORE_GRF Register Description ..... 729
6.7 LITCORE_GRF Register Description ..... 732
6.8 DSU_GRF Register Description ..... 734

Rockchip Confidencial

6.9 DDR_GRF Register Description ..... 740
6.10 CENTER_GRF Register Description ..... 760
6.11 GPU_GRF Register Description ..... 763
6.12 NPU_GRF Register Description ..... 765
6.13 VOP_GRF Register Description ..... 769
6.14 VO0_GRF Register Description ..... 777
6.15 VO1_GRF Register Description ..... 786
6.16 USB_GRF Register Description ..... 800
6.17 PHP_GRF Register Description ..... 816
6.18 CSIDPHY_GRF Register Description ..... 858
6.19 PCIe3PHY_GRF Register Description ..... 859
6.20 PIPE_PHY_GRF Register Description ..... 928
6.21 USBDPPHY_GRF Register Description ..... 939
6.22 USB2PHY_GRF Register Description ..... 941
6.23 HDPTXPHY_GRF Register Description ..... 952
6.24 MIPICDPHY_GRF Register Description ..... 954
6.25 PMU1_IOC Register Description ..... 956
6.26 PMU2_IOC Register Description ..... 967
6.27 BUS_IOC Register Description ..... 983
6.28 VCCIO1_4_IOC Register Description ..... 1008
6.29 VCCIO3_5_IOC Register Description ..... 1028
6.30 VCCIO2_IOC Register Description ..... 1063
6.31 VCCIO6_IOC Register Description ..... 1068
6.32 EMMC_IOC Register Description ..... 1081
6.33 Application Notes ..... 1089
Chapter 7 Power Management Unit (PMU) ..... 1091
7.1 Overview ..... 1091
7.2 Block Diagram ..... 1091
7.3 Function Description ..... 1092
7.4 Register Description ..... 1098
7.5 Application Notes ..... 1268
Chapter 8 MMU600 ..... 1273
8.1 Overview ..... 1273
8.2 Block Diagram ..... 1275
8.3 Function Description ..... 1275
Chapter 9 MCU Subsystem ..... 1276
9.1 Overview ..... 1276
9.2 Block Diagram ..... 1276
9.3 Register Description ..... 1278
9.4 Interface Description ..... 1296
9.5 Application Notes ..... 1297
Chapter 10 Timer ..... 1301
10.1 Overview ..... 1301
10.2 Block Diagram ..... 1301
10.3 Function Description ..... 1302
10.4 Register Description ..... 1305
10.5 Application Notes ..... 1311
Chapter 11 GIC600 ..... 1312
11.1 Overview ..... 1312
11.2 Block Diagram ..... 1313
11.3 Function Description ..... 1313
Chapter 12 DMA Controller (DMAC) ..... 1314
12.1 Overview ..... 1314
12.2 Block Diagram ..... 1315
12.3 Function Description ..... 1316
12.4 Register Description ..... 1317

Rockchip Confidential

12.5 Timing Diagram ..... 1364
12.6 Application Notes ..... 1364
Chapter 13 SDMMC_BUFFER ..... 1371
13.1 Overview ..... 1371
13.2 Block Diagram ..... 1371
13.3 Function Description ..... 1371
13.4 Interface Description ..... 1371
13.5 Application Notes ..... 1371
Chapter 14 Temperature-Sensor ADC (TS-ADC) ..... 1372
14.1 Overview ..... 1372
14.2 Block Diagram ..... 1372
14.3 Function Description ..... 1372
14.4 Register Description ..... 1373
14.5 Application Notes ..... 1393
Chapter 15 Debug ..... 1394
15.1 Overview ..... 1394
15.2 Block Diagram ..... 1394
15.3 Function Description ..... 1394
15.4 Register Description ..... 1394
15.5 Interface Description ..... 1395
Chapter 16 Mailbox ..... 1397
16.1 Overview ..... 1397
16.2 Block Diagram ..... 1397
16.3 Function Description ..... 1397
16.4 Register Description ..... 1397
16.5 Application Notes ..... 1401
Chapter 17 Watchdog Timer(WDT) ..... 1403
17.1 Overview ..... 1403
17.2 Block Diagram ..... 1403
17.3 Function Description ..... 1403
17.4 Register Description ..... 1404
17.5 Application Notes ..... 1407
Chapter 18 Pulse Width Modulation (PWM) ..... 1408
18.1 Overview ..... 1408
18.2 Block Diagram ..... 1409
18.3 Function Description ..... 1409
18.4 Register Description ..... 1410
18.5 Interface Description ..... 1429
18.6 Application Notes ..... 1432
Chapter 19 UART ..... 1435
19.1 Overview ..... 1435
19.2 Block Diagram ..... 1435
19.3 Function Description ..... 1436
19.4 Register Description ..... 1438
19.5 Interface Description ..... 1457
19.6 Application Notes ..... 1464
Chapter 20 GPIO ..... 1468
20.1 Overview ..... 1468
20.2 Block Diagram ..... 1468
20.3 Function Description ..... 1468
20.4 Register Description ..... 1469
20.5 Interface Description ..... 1479
20.6 Application Notes ..... 1490
Chapter 21 I2C Interface ..... 1491
21.1 Overview ..... 1491

Rockchip Confidential

21.2 Block Diagram ..... 1491
21.3 Function Description ..... 1492
21.4 Register Description ..... 1494
21.5 Interface Description ..... 1503
21.6 Application Notes ..... 1508
Chapter 22 I2S ..... 1511
22.1 Overview ..... 1511
22.2 Block Diagram ..... 1512
22.3 Function description ..... 1513
22.4 Register description ..... 1518
22.5 Interface Description ..... 1543
22.6 Application Notes ..... 1548
Chapter 23 SPDIF Transmitter ..... 1550
23.1 Overview ..... 1550
23.2 Block Diagram ..... 1551
23.3 Function description ..... 1551
23.4 Register Description ..... 1553
23.5 Interface Description ..... 1559
23.6 Application Notes ..... 1560
Chapter 24 SPDIF Receiver ..... 1561
24.1 Overview ..... 1561
24.2 Block Diagram ..... 1561
24.3 Function description ..... 1562
24.4 Register Description ..... 1564
24.5 Interface Description ..... 1572
24.6 Application Notes ..... 1573
Chapter 25 Gigabit Media Access Controller (GMAC) ..... 1574
25.1 Overview ..... 1574
25.2 Block Diagram ..... 1577
25.3 Function Description ..... 1578
25.4 Register Description ..... 1583
25.5 Interface Description ..... 1798
25.6 Application Note ..... 1800
Chapter 26 SAR-ADC ..... 1824
26.1 Overview ..... 1824
26.2 Block Diagram ..... 1824
26.3 Function Description ..... 1824
26.4 Register Description ..... 1824
26.5 Timing Diagram ..... 1842
26.6 Application Notes ..... 1842
Chapter 27 Digital Audio Codec ..... 1843
27.1 Overview ..... 1843
27.2 Block Diagram ..... 1843
27.3 Function description ..... 1844
27.4 Register Description ..... 1844
27.5 Interface Description ..... 1855
27.6 Application Notes ..... 1855
Chapter 28 Voice Activity Detect (VAD) ..... 1857
28.1 Overview ..... 1857
28.2 Block Diagram ..... 1857
28.3 Function Description ..... 1858
28.4 Register Description ..... 1860
28.5 Application Notes ..... 1869
Chapter 29 CAN ..... 1872
29.1 Overview ..... 1872

Rockchip Confidencial

29.2 Features ..... 1872
29.3 Function Description ..... 1873
29.4 Register Description ..... 1879
29.5 Interface Description ..... 1898
29.6 Application Notes ..... 1899
Chapter 30 Flexible Serial Peripheral Interface (FSPI ) ..... 1903
30.1 Overview ..... 1903
30.2 Block Diagram ..... 1903
30.3 Function Description ..... 1903
30.4 Register Description ..... 1904
30.5 Interface Description ..... 1922
30.6 Application Notes ..... 1924
Chapter 31 Serial Peripheral Interface (SPI) ..... 1928
31.1 Overview ..... 1928
31.2 Block Diagram ..... 1928
31.3 Function Description ..... 1930
31.4 Register Description ..... 1931
31.5 Interface Description ..... 1940
31.6 Application Notes ..... 1945
Chapter 32 SPINLOCK ..... 1948
32.1 Overview ..... 1948
32.2 Block Diagram ..... 1948
32.3 Register Description ..... 1948
Chapter 33 KEYLAD ..... 1949
33.1 Overview ..... 1949
33.2 Block Diagram ..... 1949
33.3 Function Description ..... 1950
33.4 Register Description ..... 1950
33.5 Application Note ..... 1964
Chapter 34 Share Memory ..... 1965
34.1 Overview ..... 1965
34.2 Block Diagram ..... 1965
34.3 Function Description ..... 1965
34.4 Register Description ..... 1965
34.5 Application Notes ..... 1969
Chapter 35 DECOM ..... 1972
35.1 Overview ..... 1972
35.2 Block Diagram ..... 1972
35.3 Function Description ..... 1972
35.4 Register Description ..... 1974
35.5 Application Notes ..... 1983
Chapter 36 RKNN ..... 1984
36.1 Overview ..... 1984
36.2 Block Diagram ..... 1984
36.3 Function Description ..... 1985
36.4 Register Description ..... 1986
36.5 Application Notes ..... 2052
Chapter 37 Video Capture (VICAP) ..... 2058
37.1 Overview ..... 2058
37.2 Block Diagram ..... 2058
37.3 Function Description ..... 2058
37.4 VICAP Register Description ..... 2065
37.5 Interface Description ..... 2255
37.6 Application Notes ..... 2257
Chapter 38 FishEye Correction(FEC) ..... 2259

Rockchip Confidencial

38.1 Overview ..... 2259
38.2 Block Diagram ..... 2259
38.3 Function Description ..... 2259
38.4 Register Description ..... 2261
38.5 Application Notes ..... 2275
Chapter 39 Pulse Density Modulation Interface Controller ..... 2276
39.1 Overview ..... 2276
39.2 Block Diagram ..... 2276
39.3 Function Description ..... 2277
39.4 Register Description ..... 2278
39.5 Interface Description ..... 2285
39.6 Application Notes ..... 2287

Rockchip Confidential

# Chapter 1 System Overview

## 1.1 Address Mapping

RK3588 boot from internal BootRom, which supports remap function by software programming. Remap is controlled by PMU_SGRF_SOC_CON2[1:0]. When remap is set to 2'b01, the BootRom is un-accessible and PMU_SRAM is mapped to address 0xFFFF0000. When remap is set to 2'b10, the BootRom is un-accessible and SYSTEM_SRAM is mapped to address 0xFFFF0000.

| 0xFF000000 | SYSTEM_SRAM(1MB) | 0xFF000000 | SYSTEM_SRAM(1MB) | 0xFF000000 | SYSTEM_SRAM(1MB) |

## 1.2 System Boot

RK3588 provides system boot from off-chip devices such as SDMMC card, eMMC memory, serial Nand or Nor flash. When boot code is not ready in these devices, also provide system code download into them by USB OTG interface. All of the boot code will be stored in internal BootRom. The following is the whole boot procedure for boot code, which will be stored in BootRom in advance.

The following features are supported.

- Support system boot from the following device:
  - Serial Nor Flash, 1bit or 4bits data width(device layout in FSPI IO)
  - Serial Nand Flash, 1bit data width(device layout in FSPI IO)
  - eMMC Interface, 8bits data width
  - SDMMC Card, 4bits data width
  - RK3588 has two bootwom:
    - Normal Bootrom in non-secure world, which CPU_S and CPU_NS both can access
    - Secure Bootrom in secure world, only CPU_S can access
- Support system code download by USB OTG

## 1.3 System Interrupt Connection

RK3588 provides an general interrupt controller (GIC) for CPU, which has 512 SPI (shared peripheral interrupts) interrupt sources and 12 PPI(Private peripheral interrupt) interrupt source. The triggered type for each SPI interrupt is high level sensitive, and triggered type for each PPI interrupt is low level sensitive, not programmable. The detailed interrupt sources connection is in the following table.

Table 1-3 RK3588 Interrupt Connection List

| Number | Source | Polarity | Number | Source | Polarity |
|---|---|---|---|---|---|
| 0-21 PPI | NA | Low level | 238 | irq_fspi | High level |

# Chapter 2 CRU

## 2.1 Overview

The CRU is an APB slave module that is designed for generating all of the internal and system clocks, resets in the chip. CRU generates system clocks from PLL output clock or external clock source, and generates system reset from external power-on-reset, watchdog timer reset or software reset or temperature sensor.
The CRU is located at several addresses.

| | Description | Base Address |
|---|---|---|
| CRU | Used for always on system. | 0xFD7C0000 |
| PHPTOPCRU | Used for php system. | 0xFD7C8000 |
| SECURECRU | Used for secure system. | 0xFD7D0000 |
| SBUSCRU | Used for secure bus system. | 0xFD7D8000 |
| PMU1SCRU | Used for secure pmu system. | 0xFD7E0000 |
| PMU1CRU | Used for pmu system. | 0xFD7F0000 |
| DDR0CRU | Used for DDR0 phy. | 0xFD800000 |
| DDR1CRU | Used for DDR1 phy. | 0xFD804000 |
| DDR2CRU | Used for DDR2 phy. | 0xFD808000 |
| DDR3CRU | Used for DDR3 phy. | 0xFD80C000 |
| BIGCORE0CRU | Used for pd bigcore0 system. | 0xFD810000 |
| BIGCORE1CRU | Used for pd bigcore1 system. | 0xFD812000 |
| DSUCRU | Used for pd dsu system. | 0xFD818000 |

The CRU supports the following features:

- Compliance with AMBA APB interface
- Embedded with 5 fractional PLLs, 5 integer PLLs and 8 DDRPLLs in different CRUs
- Flexible selection of clock source
- Support dividing clock separately
- Support gating clock separately
- Support software reset each module separately

| PLL TYPE / PD | FRACPLL | DDRPLL | INTPLL |
|---|---|---|---|
| CRU | V0PLL,AUPLL,CPLL,GPLL | | NPLL |
| BIGCORE0CRU | | | B0PLL |
| BIGCORE1CRU | | | B1PLL |
| DSUCRU | | | LPLL |
| SBUSCRU | | | SPLL |
| DDR0CRU | | D0APLL,D0BPLL | |
| DDR1CRU | | D1APLL,D1BPLL | |
| DDR2CRU | | D2APLL,D2BPLL | |
| DDR3CRU | | D3APLL,D3BPLL | |
| PHPTOPCRU | PPLL | | |

## 2.2 Block Diagram

The CRU comprises with:

- PLL
- Register configuration unit

Rockchip Confidential

- Clock generate unit
- Reset generate unit

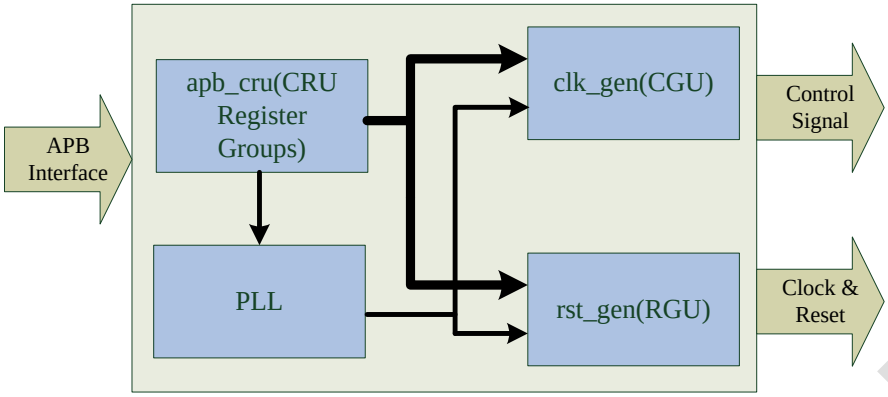

Fig. 2-1 CRU Block Diagram

## 2.3 Function Description

### 2.3.1 System Clock Solution

All R3588 PLLs receive 24MHz oscillator as input reference clock.
NPLL/GPLL/V0PLL/AUPLL/CPLL/SPLL can be set to three work modes: normal mode, slow mode and deep slow mode. When power on or changing PLL setting, we must program PLL into slow mode or deep slow mode.
To maximize the flexibility, some of clocks can select divider source from multiple PLLs.To provide some specific frequency, another solution is integrated: fractional divider. Divfree50 divider and divfree NP5 divider are also provided for some modules.All clocks can be gated by software.
The basic units for clock generation are:

- Gating
- MUX(multiplexer)
- Divfree(Glitch free divider)
  - clk_out_freq=clk_in_freq/divisor
  - When divisor is even, the clock duty cycle of clk_out is 50%
  - When divisor is odd, the clock duty cycle of clk_out is not 50%
- Fracdiv(Fractional divider)
  - clk_out_freq=clk_in_freq*numerator/denominator, both numerator and denominator are 16 bits
- Divfree50(Glitch free divider for duty cycle 50%)
  - clk_out_freq=clk_in_freq/divisor
  - When divisor is even or odd, the clock duty cycle of clk_out is 50%
- DivFreeNP5(Glitch free divider for null point 5)
  - clk_out_freq= 2*clk_in_freq/(2*div_con+3)
  - The clock duty cycle of clk_out is not 50%

The settings of all basic units are controlled by CRU registers.

### 2.3.2 System Reset Solution

Almost all module have these reset source as the following figure shows. The ‘xxx’ in the figure is the module name.

Rockchip Confidential

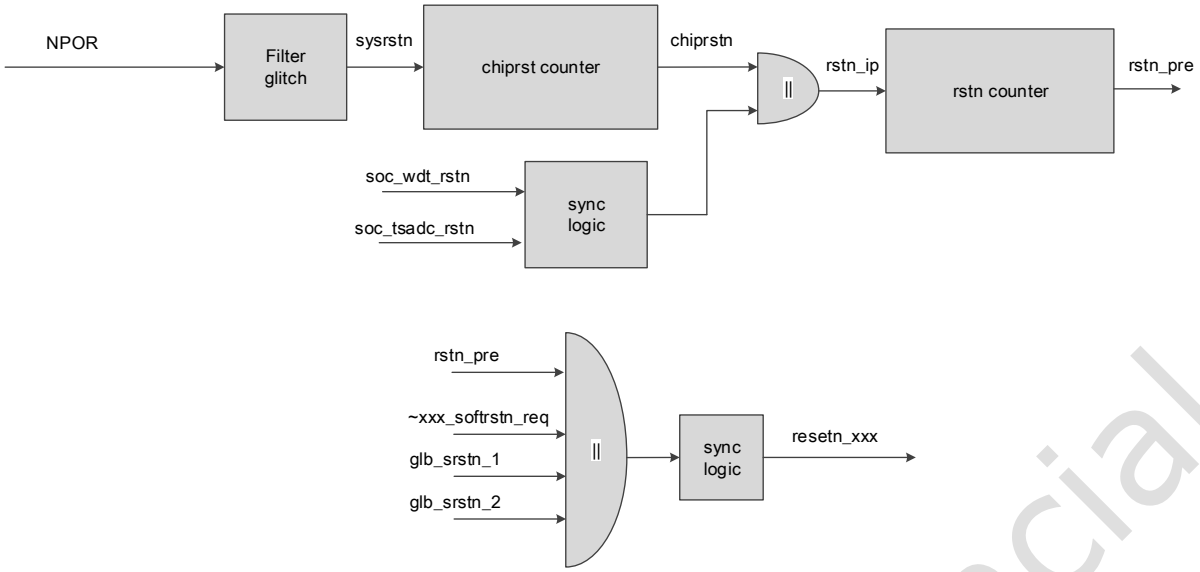

Fig. 2-2 Reset Architecture Diagram

Reset source of each reset signal includes:

- NPOR: External power on reset
- soc_wdt_rstn: Reset from WDT module
- soc_tsadc_rstn: Reset from TSADC module
- softrstn_req: Software reset request by programming CRU_SOFTRST_CON
- glb_srstn_1: First global software reset by programming CRU_GLB_SRST_FST as 0xfdb9
- glb_srstn_2: Second global software reset by programming CRU_GLB_SRST_SND as 0xeca8

### 2.3.3 PLL Introduction

PLL is a 1.8V/0.75V dual supply-voltage phase locked loop (PLL) with a wide-output-frequency-range for frequency synthesis.

| | FRACPLL | | DDRPLL | | INTPLL | |
|---|---|---|---|---|---|---|
| Parameter | MIN | MAX | MIN | MAX | MIN | MAX |

## 2.4.2 Detail Registers Description

**CRU_V0PLL_CON0**

Address: Operational Base + offset (0x0160)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16 bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15 | RW | 0x0 | v0pll_bp<br>BYPASS: Bypass mode control signal.<br>1'b1: bypass mode is enabled. (FOUT = FIN).<br>1'b0: PLL operates normally. |
| 14:10 | RO | 0x00 | reserved |

Rockchip Confidential

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 9:0 | RW | 0x000 | v0pll_m<br>M: Division value of the 10-bit programmable main-divider.<br>PLL has to be reset if M value is changed.<br>64 <= pll_m <= 1023 |

**CRU_V0PLL_CON1**

Address: Operational Base + offset (0x0164)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16 bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:14 | RO | 0x0 | reserved |
| 13 | RW | 0x0 | v0pll_resetb<br>RESETB: Power down control signal.<br>1'b0: RESETB=0 from 1, PLL starts its normal operation after lock time.<br>1'b1: RESETB=1, power down mode is enabled and all digital blocks are reset. |
| 12:9 | RO | 0x0 | reserved |
| 8:6 | RW | 0x0 | v0pll_s<br>Division value of the 3-bit programmable scaler.<br>0 <= pll_s <= 6 |
| 5:0 | RW | 0x00 | v0pll_p<br>P: Division value of the 6-bit programmable pre-divider.<br>PLL has to be reset if P value is changed.<br>1 <= pll_p <= 63 |

**CRU_V0PLL_CON2**

Address: Operational Base + offset (0x0168)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | RO | 0x0000 | reserved |
| 15:0 | RW | 0x0000 | v0pll_k<br>K: Value of 16-bit DSM.<br>pll_k[15:0] is a two's complement integer. |

**CRU_V0PLL_CON3**

Address: Operational Base + offset (0x016C)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16 bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:14 | RW | 0x0 | v0pll_sel_pf<br>SEL_PF: Value of 2-bit modulation method control.<br>2'b00: down spread;<br>2'b01: up spread;<br>2'b1x: center spread.<br>PLL has to be reset if pll_sel_pf is changed. |
| 13:8 | RW | 0x00 | v0pll_mrr<br>MRR: Value of 6-bit modulation rate control.<br>PLL has to be reset if pll_mrr is changed. |
| 7:0 | RW | 0x00 | v0pll_mfr<br>MFR: Value of 8-bit modulation frequency control.<br>PLL has to be reset if pll_mfr is changed. |

Rockchip Confidential

**CRU_V0PLL_CON4**

Address: Operational Base + offset (0x0170)

| Bit | Attr | Reset Value | Description |

## 2.5.2 Detail Registers Description

**DDR0CRU_D0APLL_CON0**

Address: Operational Base + offset (0x0000)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16 bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15 | RW | 0x1 | d0apll_bp<br>BYPASS: Bypass mode control signal.<br>1'b1: bypass mode is enabled. (FOUT = FIN).<br>1'b0: PLL operates normally. |
| 14:10 | RO | 0x00 | reserved |
| 9:0 | RW | 0x000 | d0apll_m<br>M: Division value of the 10-bit programmable main-divider.<br>PLL has to be reset if M value is changed.<br>64 <= pll_m <= 1023 |

**DDR0CRU_D0APLL_CON1**

Address: Operational Base + offset (0x0004)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16 bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:14 | RO | 0x0 | reserved |
| 13 | RW | 0x0 | d0apll_resetb<br>RESETB: Power down control signal.<br>1'b0: RESETB=0 from 1, PLL starts its normal operation after lock time.<br>1'b1: RESETB=1, power down mode is enabled and all digital blocks are reset. |
| 12:9 | RO | 0x0 | reserved |
| 8:6 | RW | 0x0 | d0apll_s<br>Division value of the 3-bit programmable scaler.<br>0 <= pll_s <= 6 |
| 5:0 | RW | 0x00 | d0apll_p<br>P: Division value of the 6-bit programmable pre-divider.<br>PLL has to be reset if P value is changed.<br>1 <= pll_p <= 63 |

**DDR0CRU_D0APLL_CON2**

Address: Operational Base + offset (0x0008)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | RO | 0x0000 | reserved |

Rockchip Confidential

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 15:0 | RW | 0x0000 | d0apll_k<br>K: Value of 16-bit DSM.<br>pll_k[15:0] is a two's complement integer. |

**DDR0CRU_D0APLL_CON3**

Address: Operational Base + offset (0x000C)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16 bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:14 | RW | 0x0 | d0apll_sel_pf<br>SEL_PF: Value of 2-bit modulation method control.<br>2'b00: down spread;<br>2'b01: up spread;<br>2'b1x: center spread.<br>PLL has to be reset if pll_sel_pf is changed. |
| 13:8 | RW | 0x00 | d0apll_mrr<br>MRR: Value of 6-bit modulation rate control.<br>PLL has to be reset if pll_mrr is changed. |
| 7:0 | RW | 0x00 | d0apll_mfr<br>MFR: Value of 8-bit modulation frequency control.<br>PLL has to be reset if pll_mfr is changed. |

**DDR0CRU_D0APLL_CON4**

Address: Operational Base + offset (0x0010)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16 bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15 | RW | 0x0 | d0apll_fsel<br>FSEL: Monitoring pin.<br>1'b0: FEED_OUT = FREF.<br>1'b1: FEED_OUT = FEED. |
| 14 | RW | 0x0 | d0apll_feed_en<br>FEED_EN: Monitoring pin.<br>1'b0: FEED_OUT is disabled.<br>1'b1: FEED_OUT is enabled. |
| 13:9 | RO | 0x00 | reserved |
| 8:4 | RW | 0x00 | d0apll_extafc<br>EXTAFC: Monitoring pin.<br>If pll_afc_enb=1, AFC is disabled and VCO is calibrated manually by pll_extafc[4:0] for the test of VCO range. |
| 3 | RW | 0x0 | d0apll_afc_enb<br>AFC_ENB: Monitoring pin.<br>1'b0: AFC is enabled and VCO is calibrated automatically.<br>1'b1: AFC is disabled and VCO is calibrated manually by pll_extafc[4:0] for the test of VCO range. |
| 2:1 | RO | 0x0 | reserved |
| 0 | RW | 0x0 | d0apll_sscg_en<br>SSCG_EN: Enable pin for dithered mode.<br>1'b0: disable dithered mode.<br>1'b1: enable dithered mode. |

# 2.17 Application Notes

## 2.17.1 PLL Usage

### 2.17.1.1 Start-up Operation

Set the registers (such as P[5:0], M[9:0] and so on) at time t3 after setting the power from 0V to VDD at time t2.

Set RESETB=0 before PLL starts to operate. Then set RESETB=1 at t4 to initialize PLL and to start AFC. Note that PLL generates a clock signal with the desired frequency only after Lock time has been passed.

Rockchip Confidencial

To change the P[5:0] and M[9:0], PLL must be initialized. However S[2:0] and BYPASS can be changed without the initialization of PLL. The other input pins are not allowed to be changed after PLL is locked.
To ensure that the register values and operation-mode controls are stable, the time intervals of Δt2(t4-t2) and Δt3(t4-t3) should be greater than 1μs and 1/$F_{FREF}$ respectively.

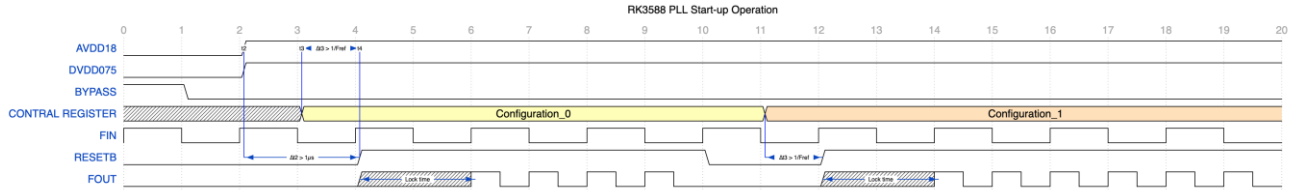

Fig. 2-6 PLL Start-up Operation

### 2.17.1.2 Bypass Operation

Bypass mode functions only when PLL is operating (RESETB=1). When ΔT > lock time (as illustrated in Fig. 2-7), PLL generates a stable clock signal with desired target frequency.

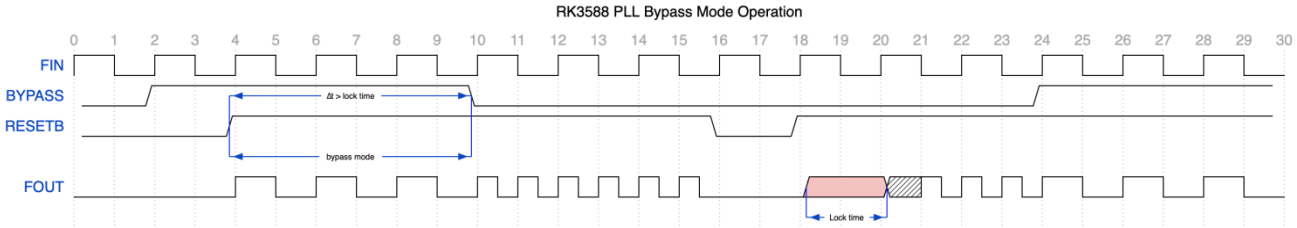

Fig. 2-7 PLL Bypass Operation

### 2.17.1.3 Glitch-free Scaler Operation

S[2:0] can be changed after PLL is locked. The timing diagram of glitch-free scaler is illustrated in figure below.
When S[2:0] or BYPASS is changed, FOUT first maintains output frequency during max. 3 cycles of FIN and then moves to logic low for 2 cycles of FIN. After completing the re-initialization time, FOUT goes to the desired frequency.
To guarantee the glitch-free functionality of scaler in PLL which needs re-initialization time for max 5 cycles of FIN, FIN has to be lower than FOUT. If FIN is higher than FOUT, set FOUT_MASK=1. Note that the maximum re-initialization time for the case of FOUT_MASK=1 takes 8 times longer than that for the case of FOUT_MASK=0.

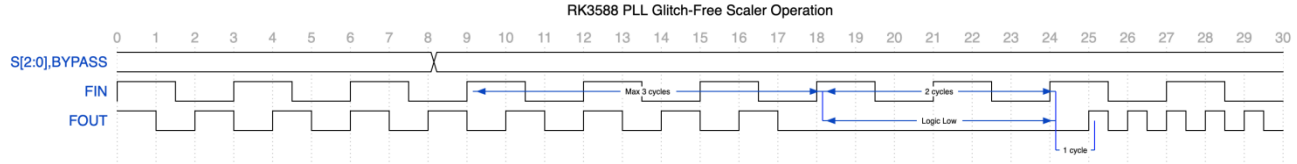

Fig. 2-8 PLL Glitch-free Scaler Operation

### 2.17.1.4 Setting Guide on P, M, S, and K

p, m, s, and k are decimal values of P[5:0], M[9:0], S[2:0], and K[15:0], respectively. (where p = P[5:0], m = M[9:0], s = S[2:0], and k = K[15:0])
FFVCO and FFOUT are calculated by the following equation.

| PLL Type | Equation |
|---|---|
| FRACPLL | FFVCO = ((m + k / 65536) * FFIN) / p<br>FFOUT = ((m + k / 65536) * FFIN) / (p * $2^s$) |
| DDRPLL | FFVCO = ((m + k / 65536) * 2 * FFIN) / p<br>FFOUT = ((m + k / 65536) * 2 * FFIN) / (p * $2^s$) |
| INTPLL | FFVCO = (m * FFIN) / p<br>FFOUT = (m * FFIN) / (p * $2^s$) |
| Parameter | 1 <= p <= 63, 64 <= m <= 1023, 0 <= s <= 6 |

P[5:0], M[9:0] and S[2:0] are unsigned integers. K[15:0] is a two's complement integer.
6'b00_0001 <= P[5:0] <= 6'b11_1111

Rockchip Confidential

10'b00_0100_0000 <= M[9:0] <= 10'b11_1111_1111
3'b000 <= S[2:0] <= 3'b110
16'b1000_0000_0000_0000 <= K[15:0] <= 16'b0111_1111_1111_1111
Setting P[5:0] or M[9:0] to all zeros is strictly prohibited while RESETB = 1. (6'b00_0000 / 10'b00_0000_0000) The division ratio of scaler is controlled by S[2:0] as summarized.

#### 2.17.1.5 Setting Guide on SSCG_EN, SEL_PF, MFR and MRR

When SSCG_EN is set to logic high, the spread spectrum mode is enabled.
sel_pf, mfr, and mrr are decimal values of SEL_PF[1:0], MFR[7:0] and MRR[5:0], respectively. (where sel_pf = SEL_PF[1:0], mfr = MFR[7:0], mrr = MRR[5:0])
Modulation frequency, MF, is determined by the following equation:
MF = FFIN / p / mfr / ($2^5$)[Hz].
Modulation rate(pk-pk), MR, is determined by the following equation:
MR = mfr * mrr / m / ($2^6$) * 100 [%].
Modulation mode is determined by sel_pf.
00: down spread, 01: up spread, 1x: center spread
Range of registers.
8'b0000_0000 <= MFR[7:0] <= 8'b1111_1111
6'b00_0001 <= MRR[5:0] <= 6'b11_1111
0 <= mrr * mfr <= 512
2'b00 <= SEL_PF[1:0] <= 2'b10

#### 2.17.1.6 Setting Guide on RESETB and BYPASS

RESETB is a reset signal of PLL. PLL enters the power down mode when RESETB = 0.
BYPASS enables the bypass mode of PLL. When BYPASS = 1, PLL enters the bypass mode and FOUT is equal to FIN.

### 2.17.2 Divider Usage

CRU supports multi-dividers for different clock requirement.

- Divider free divider
- Fractional divider
- DivfreeDT50 divider(DT50)
- DivfreeNP5 divider(NP5)

#### 2.17.2.1 DivFree Divider Usage

Frequency of this divider=clk_src/(n+1).

#### 2.17.2.2 Fractional Divider Usage

To get specific frequency, clocks of I2S, audio PWM, UART and SPDIF can be generated by fractional divider. Generally you should set that denominator 20 times larger than numerator to generate precise clock frequency. So the fractional divider applies only to generate low frequency clock.

#### 2.17.2.3 DivfreeDT50 Divider Usage

Some modules like EMMC, SDIO, SDMMC need clock of 50% duty cycle, divfree50 can generate clock of 50% duty cycle even in odd value divisor.

#### 2.17.2.4 DivFreeNP5 Divider Usage

Some modules need some special frequency can use this divider. Frequency of this divider=clk_src/((2*n+3)/2).

### 2.17.3 Global Software Reset

Two global software resets are designed in RK3588. These two software resets are self-de-asserted by hardware. Hold time of global software reset (glb_srstn_1, glb_srstn_2, wdt_rstn, tsadc_rstn) can be programed up to 1ms.

- CRU_GLB_SRST_FST_VALUE[15:0] = 0xfdb9 to assert the first global software reset glb_srstn_1
- CRU_GLB_SRST_SND_VALUE[15:0] = 0xeca8 to assert the second global software reset glb_srstn_2

Rockchip Confidencial

- glb_srstn_1 resets almost all logic except some registers just supporting hardware reset
- glb_srstn_2 resets almost all logic except GRFs and GPIOs

Reset for IP in PD_PMU can be hold if its reset_hold_enable in PMUGRF_PMU_SOC_CON1 or PMUGRF_PMU_SOC_CON2 is high even if glb_srstn_1 or glb_srstn_2 active.

Rockchip Confidencial

# Chapter 3 CPU

## 3.1 Overview

The RK3588 has a cluster with quad-core Cortex-A55 and quad-core Cortex-A76 of which the cores are all single-threaded. Cortex-A55 processor, which is a mid-range, low-power processor that implements the ARMv8-A architecture. And the Cortex-A76 core is a high-performance and low-power Arm product that implements the Armv8-A architecture.

The processor includes following features:

- Full implementation of the Armv8.2-A A64, A32, and T32 instruction sets
- Both the AArch32 and AArch64 execution states at all Exception levels (EL0 to EL3)
- In-order pipeline with direct and indirect branch prediction
- Separate L1 data and instruction side memory systems with a Memory Management Unit (MMU)
- Support for Arm TrustZone technology
- Support data engine that implements the Advanced SIMD and floating-point architecture support
- Support Cryptographic Extension
- ARMv8 debug logic
- Support Generic Interrupt Controller (GIC) CPU interface to connect to an external distributor
- Generic Timers supporting 64-bit count input from an external system counter

The configuration details are shown in following tables

Table 3-1 CPU Configuration

| | |
|---|---|
| Number of little cores(A55) | 4 |
| Number of big cores(A76) | 4 |
| L1 I cache size of A55 | 32K |
| L1 D cache size of A55 | 32K |
| L2 cache size of A55 | 128K |
| L1 I cache size of A76 | 64K |
| L1 D cache size of A76 | 64K |
| L2 cache size of A76 | 512K |
| L3 cache size | 3072K |
| L3 data RAM output latency | 3 cycles |
| L3 data RAM input latency | 2p cycles |
| CPU cache protection | No |
| DSU L3 cache protection | No |
| BUS master interface | AXI4 |
| NEON and floating-point support | Yes |
| Cryptography extension | Yes |

## 3.2 Block Diagram

The quad-core Cortex-A55 and quad-core Cortex-A76 subsystem is shown as below. As illustrated, the cores connect to system bus through DSU-L3 which can handle with CDC (clock domain crossing) issue.

The Cortex-A55 and Cortex-A76 is connected with system counter, which can run under a constant frequency clock, for PPI interrupt generation.

Rockchip Confidencial

## 3.3 Function Description

Please refer to the document cortex_a55_r2p0_trm.pdf, cortex_a76_r4p0_trm.pdf and dsu_r4p1_trm.pdf for the detail function description.

Rockchip Confid

# Chapter 4 Graphics Process Unit (GPU)

## 4.1 Overview

The Mali-G610 GPU is a graphics acceleration platform that is based on open standards. It supports 2D graphics, 3D graphics, and General Purpose computing on GPU (GPGPU).

### 4.1.1 Features

The features listed below which may or may not be present in actual product, may be subject to the third party licensing requirements. Please contact Rockchip for actual product feature configurations and licensing requirements.

The Arm Mali-G610 GPU has significant features and properties.

- Support of multiple clock and voltage domains, allowing you to maximize performance within a given power budget.
- Programmable architecture.
- API feature set with support for shader-based and fixed-function graphics APIs.
- Anti-aliasing capabilities.
- Effective core for General Purpose computing on GPU (GPGPU) applications.
- High memory bandwidth and low power consumption for 3D graphics content.
- Scalability for products from smartphones to high-end mobile computing.
- Performance leading 3D graphics.
- AMBA 4 AXI-Lite slave interface for GPU configuration.
- 128-bit or 256-bit AMBA 4 ACE master interface for external memory access.
- Easy integration.
- Latency tolerance.
- Compressed texture formats.
- Configurable per-core power management for enabling the optimal power and performance combination for each application.
- Coherency aware interconnects for system memory and resource sharing.
- Arm Frame Buffer Compression (AFBC) 1.3.
- 8-bit, 10-bit, and 16-bit YUV input and output formats.
- Secure processing of DRM-protected content.
- Support Serial Wire debug for embedded MCU

### 4.1.2 Standard

The GPU hardware and software support compute standards and graphics API standards.

The GPU supports these compute API standards:

- OpenCL 2.2 Full Profile

The GPU supports these graphics API standards:

- OpenGLES 1.1, 2.0, and 3.2
- Vulkan 1.2

Rockchip Confidential

## 4.2 Block Diagram

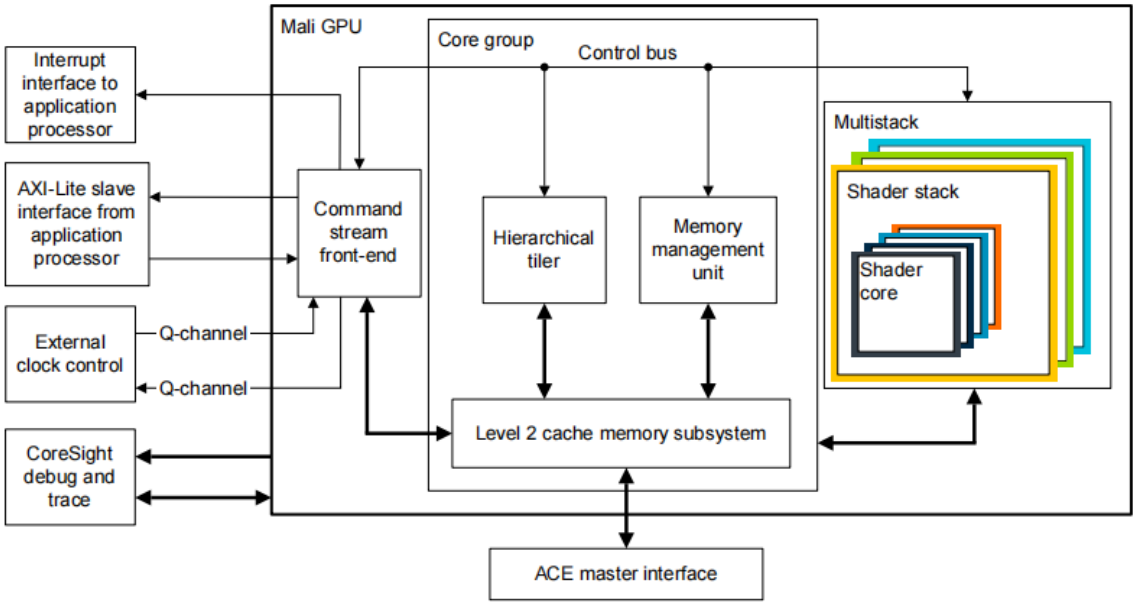

Fig. 4-1 GPU Architecture

## 4.3 Function Description

Please refer to the document "ARM_Odin_r0p0_00eac0_TechnicalReferenceManual.pdf" for the GPU detail description.

## 4.4 Register Description

Please refer to the document "ARM_Odin_r0p0_00eac0_TechnicalReferenceManual.pdf" for the GPU detail description.

## 4.5 Interface Description

There are two sets of serial debug interface for the embedded MCU. When we debug using serial wire, not only set IOMUX, but also configure the bit[11:10] of SYS_GRF_SOC_CON10 to select the GPU MCU.

Table 4-1 MCU Serial Wire Debug Interface Description

| Module Pin | Direction | Pad Name | IOMUX Setting |
|---|---|---|---|
| mcujtag_tckm0 | I | SDMMC_CMD/PDM1_CLK1_M0/MCU_JTAG_TCK_M0/CAN0_TX_M1/UART5_RX_M0/PWM7_IR_M1/GPIO4_D4_u | BUS_IOC_GPIO4D_IOMUX_SEL_H[3:0] = 4'h5 |
| mcujtag_tmsm0 | I/O | SDMMC_CLK/PDM1_CLK0_M0/TEST_CLKOUT_M0/MCU_JTAG_TMS_M0/CAN0_RX_M1/UART5_TX_M0/GPIO4_D5_d | BUS_IOC_GPIO4D_IOMUX_SEL_H[7:4] = 4'h5 |
| mcujtag_tckm1 | I | HDMI_TX0_HPD_M1/PCIE30X2_PERSTN_M2/HDMI_RX_HPDOUT_M1/MCU_JTAG_TCK_M1/UART9_RX_M2/SPI0_CS0_M3/GPIO3_D4_d | BUS_IOC_GPIO3D_IOMUX_SEL_H[3:0] = 4'h6 |
| mcujtag_tmsm1 | I/O | PCIE30X4_BUTTON_RSTN/DP1_HPDIN_M0/MCU_JTAG_TMS_M1/UART9_TX_M2/PWM11_IR_M3/SPI0_CS1_M3/GPIO3_D5_d | BUS_IOC_GPIO3D_IOMUX_SEL_H[7:4] = 4'h6 |

*Notes: I=input, O=output, I/O=input/output, bidirectional*

## 4.6 Application Notes

Please refer to the document "ARM_Odin_r0p0_00eac0_TechnicalReferenceManual.pdf" for the GPU detail description.

Rockchip Confidencial

# Chapter 5 VPU

## 5.1 Overview

VPU is composed by VDPU121, VDPU381, AV1, VDPU720, VEPU121(JPEG encoder only) and VEPU580 to realize the high quality video decoding and encoding.
VDPU121 can support such as H.263, MPEG1/2/4 and so on, max solution is up to 1920x1088.
VDPU381 is a multi-format video decoder which supports H265, H264, VP9 and AVS2. It also supports dual-core decoding, max solution is up 64Kx64K.
VDPU720 is JPEG decoder.
VDPU981 is AV1 decoder.
VEPU121 is JPEG encoder.
VEPU580 is H264 and H264 combo video encoder.

### 5.1.1 Feature

The features listed below which may or may not be present in actual product, may be subject to the third party licensing requirements. Please contact Rockchip for actual product feature configurations and licensing requirements.

The features of VDPU121 decoder are listed as follows:
- MMU embedded with MMU interrupt support
- VP8 verision2, up to 1920x1088@60fps
- VC1 Simple Profile@low, medium, high levels, Main Profile@low, medium, high levels, Advanced Profile@level0~3,up to 1920x1088@60fps
- MPEG-4 Simple Profile@L0~6,Advanced Simple Profile@L0~5,up to 1920x1088@60fps
- MPEG-2 Main Profile, low, medium and high levels, up to 1920x1088@60fps
- MPEG-1 Main Profile, low, medium and high levels, up to 1920x1088@60fps
- H.263 Profile0, levels 10-70, up to 720x576@60fps
- JPEG Baseline interleaved, up to 8176x8176@76 milion pixels per second

The features of VDPU381 decoder are listed as follows:
- MMU embedded with MMU interrupt support
- Dual-core decoding support
- H.265 HEVC/MVC Main10 Profile yuv420@L6.1 up to 7680x4320@60fps, max solution up to 65472x65472
- H.264 AVC/MVC Main10 Profile yuv400/yuv420/yuv422/@L6.0 up to 7680x4320@30fps, max solution up to 65520x65520
- VP9 Profile0/2 yuv420@L6.1 up to 7680x4320@60fps, max solution up to 65472x65472
- AVS2 Profile0/2 yuv420@L10.2.6 up to 7680x4320@60fps, max solution up to 16383x16383

The features of VDPU720 decoder are listed as follows:
- Supports JPEG decoding
  - 48x48 to 65536x65536(4295Mpixels), Step size 8 pixels
  - Baseline interleaved, and supports ROI (region of image) decode

The features of VDPU981 decoder are listed as follows:
- MMU embedded with MMU interrupt support
- AV1 Main8/10 Profile yuv420 up to 3840x2160@60fps, max solution up to 7680x4320

The features of VEPU121 encoder are listed as follows:
- MMU embedded with MMU interrupt support
- Supports H264 encoding
- Supports JPEG encoding
  - JPEG: Baseline (DCT sequential)
  - JFIF file format 1.02
  - Non-progressive JPEG
  - Support image size from 96x32 to 8192x8192, step size 4 pixels
  - Up to 90 million pixels per second

The features of VEPU580 are listed as follows:
- HEVC Main Profile, Level 6.0 High Tier

Rockchip Confidencial

- H.264 High Profile, level 6.0
- Resolution upto 16384x8192
- Bitrate upto 800Mbps with CBR/VBR/FixQP/QPMAP bitrate control
- YUV420 and YUV400 format
- Slice/TILE split
- Block Mapping ROI
- 8-area OSD
- Link table configuration mode
- YUV/RGB video source with crop, rotation and mirror
- Frame Buffer Compression
- MMU Inside

## 5.2 Block Diagram

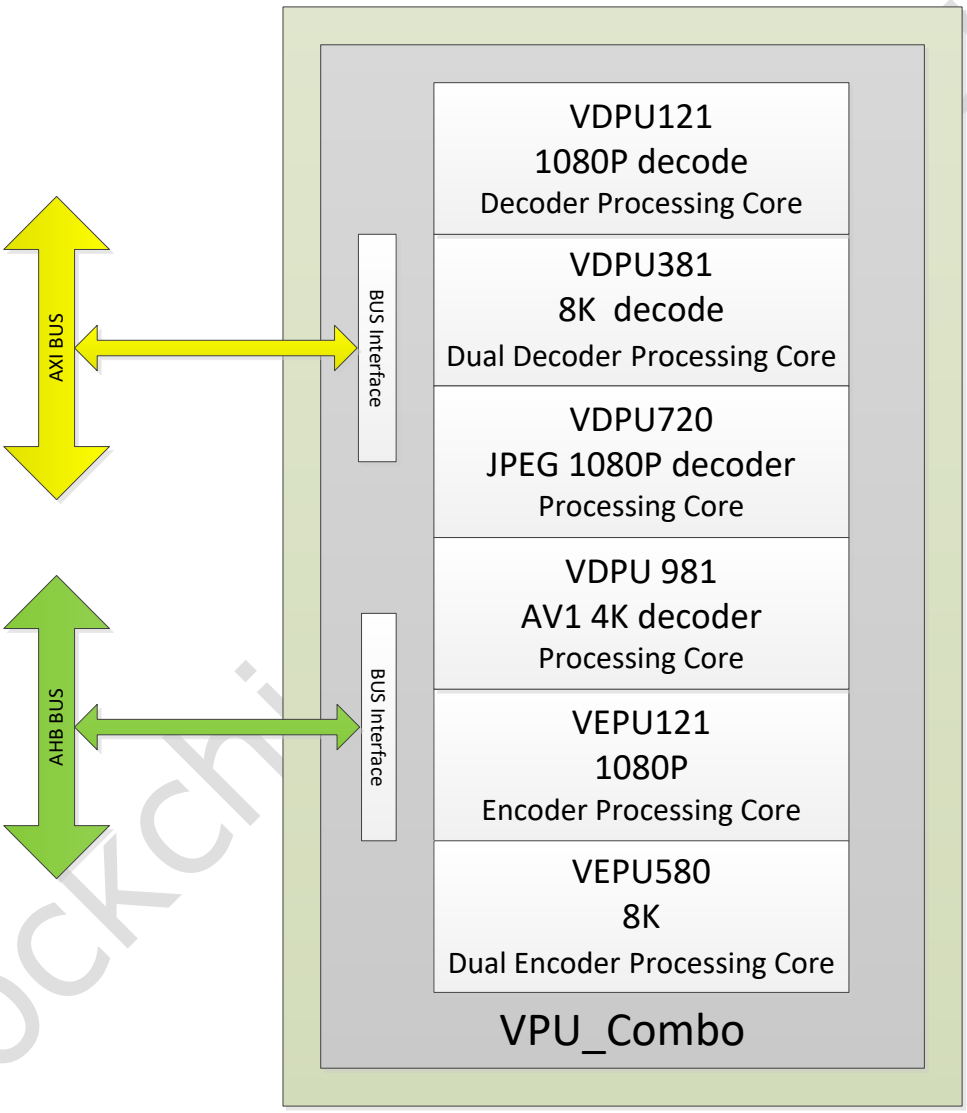

Fig. 5-1 Combo Block Diagram

As shown in the figures above, CPU accesses to the decoder register bank through AHB bus. Bitstream and other necessary data are fed into processing core though AXI read channel, and after several steps of decoding process, decoded pictures and other information data are transferred to designated location in the DDR through AXI write channel.
VDPU121 1080P processing core support multi-format decoder, such as mpeg4, h.263 and so on.
VDPU381 mult-core decoder: can support h.265/vp9/h.264/AVS2 video standard decoder, support dual-core decoding, max solution is up 64Kx64K.

Rockchip Confidential

VDPU720 processing core support jpeg decoder.
VDPU981 processing core support AV1 decoder.
VEPU121 1080P processing core support jpeg encoder.
VEPU580 mult-core encoder processing core can support HEVC/H.264 video encoder, max solution size is 16Kx16K
Please note that VDPU121 and VDPU381 and VDPU720 and AV1 and VEPU121 and VEPU580 is different IP cores, so these processing core can be work together.

# 5.3 Video frame format

This chapter describes different input and output video frame formats supported by VCODEC. Each function module has its own supported video frame formats, and this chapter describes all the video frame formats.

## 5.3.1 YCbCr 4:2:0 Planar Format

In the planar format, each video sample component forms one memory plane. Within one plane, the data has to be stored linearly and contiguously in the memory as shown in fellows. The luminance samples are stored in raster-scan order (Y0Y1 Y2Y3 Y4….). The chrominance samples are stored in two planes also in raster scan order (Cb0Cb1 Cb2Cb3 Cb4…. and Cr0Cr1 Cr2Cr3 Cr4….). In this format each pixel takes 12 bits of memory.

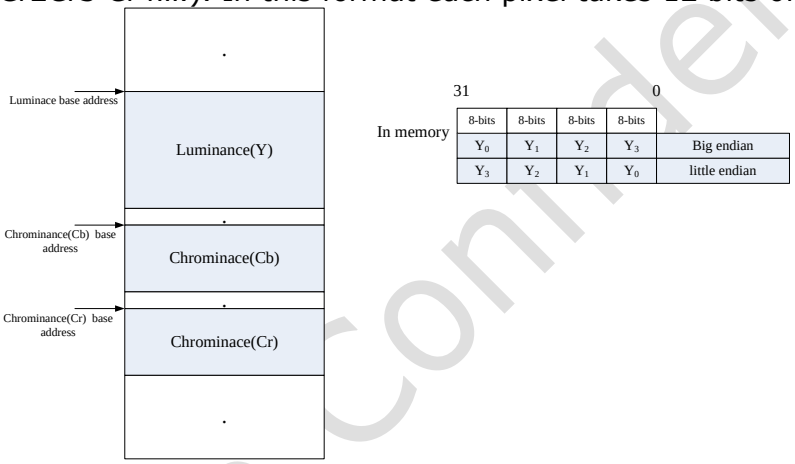

Fig. 5-2 VCODEC YCbCr 4:2:0 planar format

## 5.3.2 YCbCr 4:2:0 Semi-Planar format

In semi-planar YcbCr4:2:0 format the luminance samples from one plane in memory, and chrominance samples from another. Within one plane, the data has to be stored linearly and contiguously in the memory. The luminance pixels are stored in raster-scan order (Y0Y1 Y2Y3 Y4….). The interleaved chrominance CbCr samples are stored in raster-scan order in memory as Cb0Cr0 Cb1Cr1 Cb2 Cr2 Cb3Cr3 Cb4 Cr4….
Semi-Planar format supports both progressive and interlaced format as presented in Fig. 5-3 VCODEC YCbCr 4:2:0 Semi-planar format
. The interlaced format may be alternative line or each line.

Rockchip Confidential

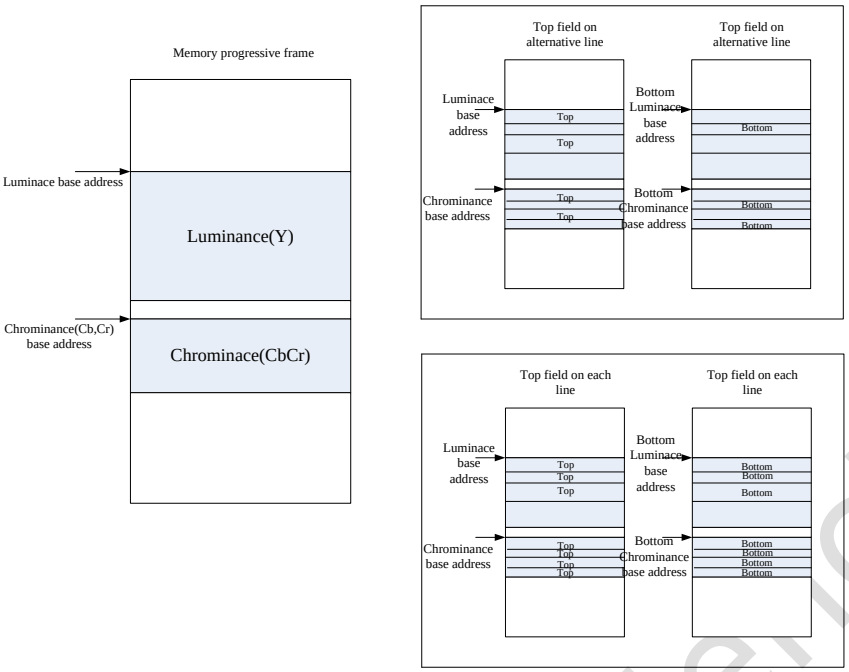

Fig. 5-3 VCODEC YCbCr 4:2:0 Semi-planar format

## 5.3.3 YCbCr 4:2:2 Interleaved Format

In the interleaved YCbCr 4:2:2 format the pixel samples from a single plane in which the data has to be stored linearly and contiguously as shown in Fig. 5-4 VCODEC YCbCr4:2:2 Interleaved format

. The pixel data is in raster scan order and the chrominance samples are interleaved between the luminance samples as Y0Cb0 Y1Cr0 Y2 Cb1 Y3Cr1 Y4 Cb2…. YCrCb, CbYCrY and CrYCbY component orders are supported also. In this format, each pixel takes 16 bits in the memory.

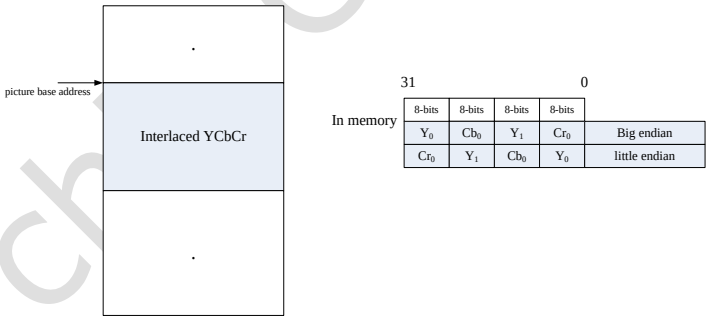

Fig. 5-4 VCODEC YCbCr4:2:2 Interleaved format

## 5.3.4 AYCbCr 4:4:4 Interleaved Format

In the interleaved YcbCr 4:2:2 format, the pixel samples from a single plane in which the data has to be stored linearly and contiguously as show in Fig. 5-5 VCODEC AYCbCr 4:4:4 Interleaved format

. The pixel data is in raster scan order and the chrominance and alpha channel samples are interleaved between the luminance samples as A0Y0 Cb0Cr0 A1 Y1 Cb1Cr1….

Rockchip Confidential

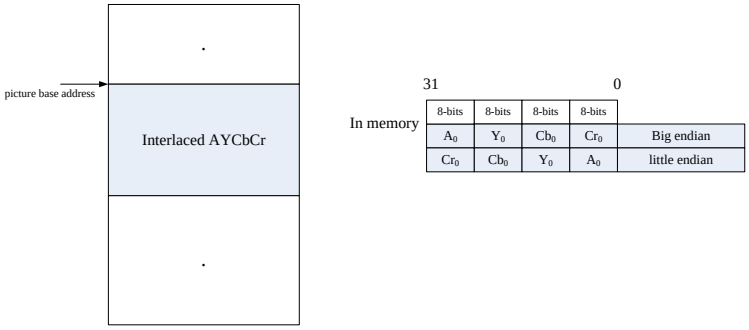

Fig. 5-5 VCODEC AYCbCr 4:4:4 Interleaved format

## 5.3.5 YCbCr Tiled Semi-Planar Format

Like the YUV semi-planar format, the tiled semi-planar format is also organized in the memory on two separate planes. The difference between these formats is that in tiled format the pixel samples are not anymore in raster-scan order but are stored macroblock (16x16 pixels or 8x8 pixels) by macroblock. The samples of each macroblock are stored in consecutive addresses and the macroblocks are ordered from left to right and from top to down as Fig. 5-6 VCODEC Tile scan mode
. When this format used as input data format, it causes the lowest bus load to the system as there is minimal amount of non-sequential memory addressing required when reading the input data to the post-processor.

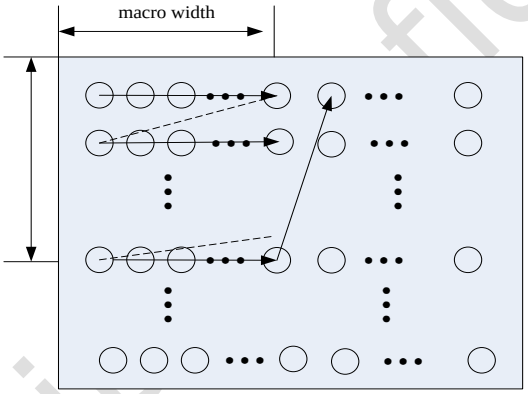

Fig. 5-6 VCODEC Tile scan mode

## 5.3.6 RGB 16bpp Format

In this format each pixel is represented by 16 or less bits containing the red, blue and green samples. There are several 16bpp formats which use different number of bits for each sample. For example the RGB 5-5-5 format uses 5 bits for each sample and 1 bit is left unused or can represent a transparency flag, where RGB 5-6-5 uses 6 bits for the G sample and 5 bits for R and B samples. Common for all 16bpp types is that two pixels fit into one 32-bit space.

Rockchip Confidential

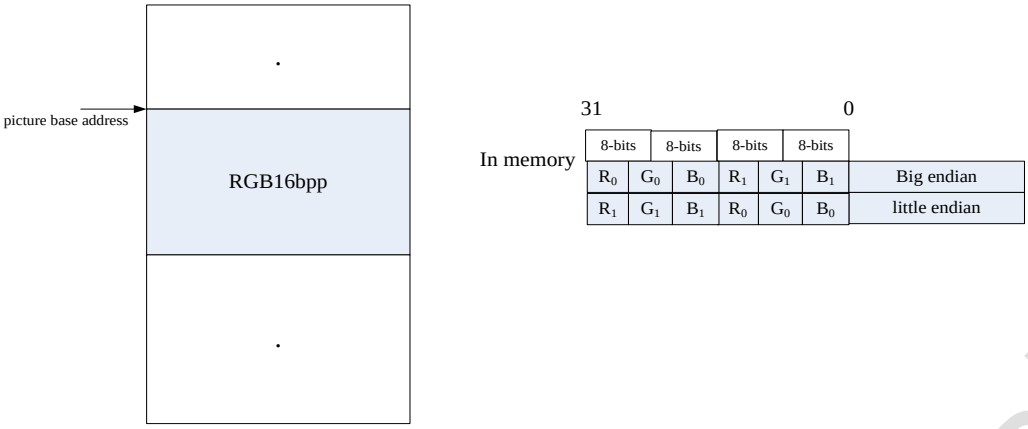

Fig. 5-7 VCODEC RGB 16bpp format

### 5.3.7 RGB 32bpp Format

Any RGB format that has its pixels represented by more than 16bits each is considered to be of 32bpp type. Typically in this format each pixel is represented by three bytes containing a red, blue and green sample and a 4th byte which can be empty or hold an alpha blending value. Common for all 32bpp types is that only one pixel fit into one 32-bit space. The data has to be stored linearly and contiguously in the memory.

### 5.3.8 Frame Buffer Compress (FBC) Format

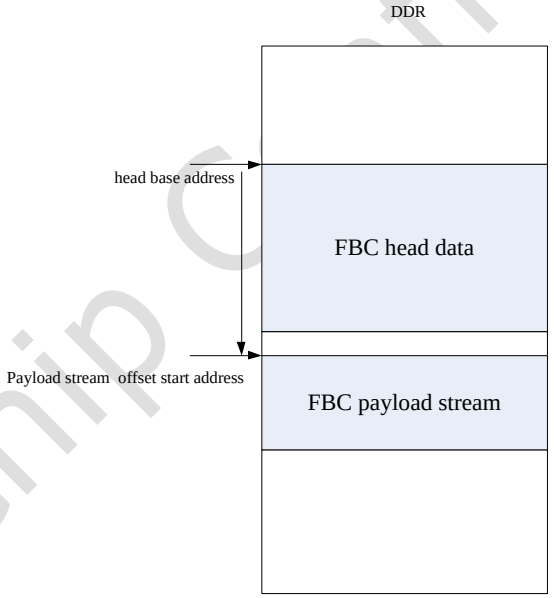

Fig. 5-8 FBC output format

As shown in the figures above, FBC output format include FBC head data and FBC payload stream. Every 16x16 block used one FBC head, every FBC head will take up 128bit ddr space, FBC HEAD is raster store and can support virtual stride. The payload stream use compact mode, and the maximum ddr space which be required is equal to uncompress picture size.

## 5.4 Function Description

### 5.4.1 MMU

The MMU divides memory into 4KB pages, where each page can be individually configured. For each page the following parameters are specified:

- Address translation of virtual memory, this enables the processor to work using address that differ from the physical address in the memory system.

Rockchip Confidential

- The permitted types of accesses to that page. Each page can permit read, write, both, or none.

The MMU use 2-level page table structure:
1. The first level, the page directory consists of 1024 directory table entries(DTEs), each pointing to a page table.
2. The second level, the page table consists of 1024 page table entries(PTEs), each pointing to a page in memory.

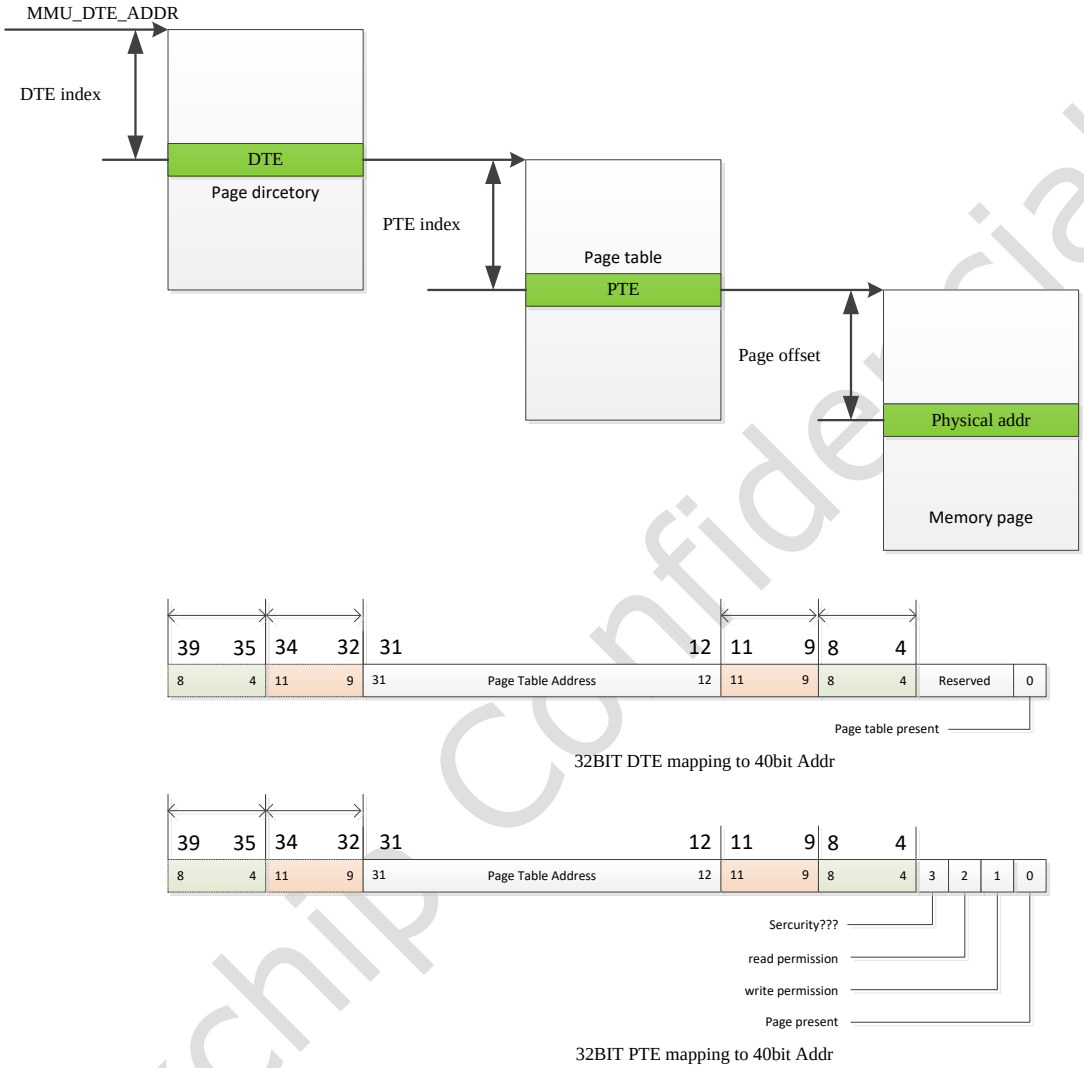

Fig. 5-9 Structure of two-level page table

## 5.4.2 VDPU121 feature supported

1. MPEG-4 decoder

The features that video decoder supports about MPEG-4/H.263 shows as below Table 5-1 MPEG-4/H.263 feature

.

Table 5-1 MPEG-4/H.263 feature

| Feature | Decoder support |
|---|---|
| Input data format | MPEG-4/H.263 elementary video stream |
| Decoding scheme | Frame by frame(or field by field)<br>Video packet by video packet |
| Output data format | YCbCr 4:2:0 semi-planar |
| Supported image size | 48x48 to 1920x1088(MPEG-4)<br>48x48 to 720x576(H.263) |

Rockchip Confidential

| Feature | Decoder support |
|---|---|
| | Step size 16 pixels |
| Maximum frame rate | 60fps at 1920x1088 |
| Maximum bit rate | As specified by MPEG-4 ASP level5 |
| Error detection and concealment | Supported |

The decoder of MPEG-4/H.263 has two operating modes: in the primary mode the HW performs entropy decoding, and in the secondary mode SW performs entropy decoding. Secondary mode is used in MPEG-4 data partitioned stream decoding.

2. MPEG-2/MPEG-1 decoder

The features of MPEG-2/MPEG-1 supported by decoder are shown as Table 5-2 MPEG-2/MPEG-1 features

.

Table 5-2 MPEG-2/MPEG-1 features

| Feature | Decoder support |
|---|---|
| Input data format | MPEG-2/MPEG-1 elementary video stream |
| Decoding scheme | Frame by frame(or field by field)<br>Video packet by video packet |
| Output data format | YCbCr 4:2:0 semi-planar |
| Supported image size | 48x48 to 1920x1088<br>Step size 16 pixels |
| Maximum frame rate | 60fps at 1920x1088 |
| Maximum bit rate | As specified by MPEG-2 MP high level |
| Error detection and concealment | Supported |

The dataflow of MPEG-2/MPEG-1 is the same of H.264 HW performs entropy decoding as **Error! Reference source not found.**.

### 5.4.3 VDPU381 feature supported

1. H265/MVC

Table 5-3 Video H.265 decoder features

| Feature | Decoder support |

## 5.4.4 VDPU381 DDR buf size requirements

### 5.4.4.1VDPU381 Input Buffer Size Requested

(1).H265 Unique input data

Table 5-7 Video H.265 decoder Unique input data

| buffer name | buffer size |
|---|---|
| MMU_table | Determined according to whether the MMU is turned on and the actual space of the MMU table |
| PPS+SPS | 7x128bit |
| RPS | 32x128bit |
| Cabac table | 11x128bit |
| Scanlist | 84x128bit |
| Stream_in | According to the actual situation |
| dpb_frame | According to the reference frame size, max reference frame num is 16 |

1-2.H264 Unique input data

Table 5-8 Video H.264 decoder Unique input data

| buffer name | buffer size |
|---|---|
| MMU_table | Determined according to whether the MMU is turned on and the actual space of the MMU table |
| PPS | 3x128bit |
| RPS | 8x128bit |
| Cabac table | 58x128bit |
| Scanlist | 13x128bit |
| Stream_in | According to the actual situation |
| dpb_frame | According to the reference frame size, max reference frame num is 16 |

1-3.VP9 Unique input data

Table 5-9 Video VP9 decoder Unique input data

| buffer name | buffer size |
|---|---|
| MMU_table | Determined according to whether the MMU is turned on and the actual space of the MMU table |
| segid | ((pic_widthxpic_height)/(8x8))x3bit |
| prob_intra | 165x128bit |
| prob_inter | 172x128bit |
| cabac_table | 368Byte |
| stream_in | According to the actual situation |
| dbp_frame | According to the reference frame size, max reference frame num is 3 |

1-4.AVS2 Unique input data

Rockchip Confidential

Table 5-10 Video AVS2 decoder Unique input data

| buffer name | buffer size |
|---|---|
| MMU_table | Determined according to whether the MMU is turned on and the actual space of the MMU table |
| PPS data | 11x128bit |
| Scanlist | |
| stream_in | According to the actual situation |
| dbp_frame | According to the reference frame size, max reference frame num is 7 |

2. Config Register Linked List Pointer mode(LLP mode)

VDPU346 Video decoder support link table mode to improve decoder continuity and reduce CPU participate and interrupt response time. In this mode, the register which used for config will be prepare into DDR, after that user enable link table mode, and then our decoder will fetch the register config information through AXI bus frame by frame. On link table mode, the decoder will auto finish all the frame decoder which be prepared in DDR, and not need CPU participate.

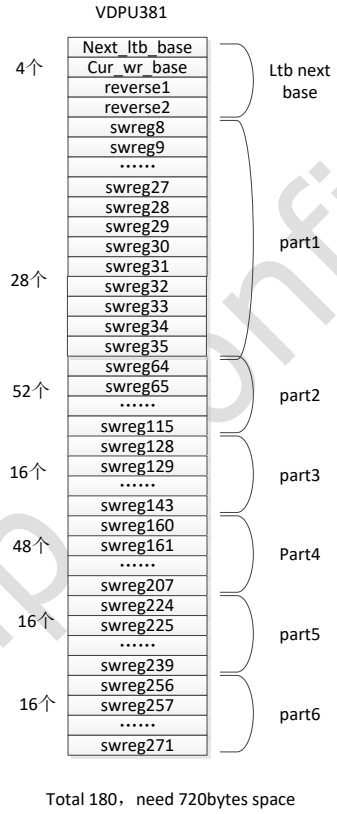

Fig. 5-10 Link table register prepare in DDR format

As show in the above Fig, Link table register prepare in DDR format, each frame config information need 720bytes in DDR. When Link table register work mode be actived, MMU should be config in first, and then parpare register to ddr, at last to config LLP ctrl register to start decoder.

For LLP work mode, LLP register buffer will be required. Every frame will require 512 byte DDR space. Then, buffer size calculate formula be defined as follows:

LLP_register_buffer_size = frame_num * 720 byte

After hardware decoder one frame, will write back some information to DDR where the write back base address is current config storage addr base. All the write back information are listed in the follows table.

Rockchip Confidential

Table 5-11 Link table write back register

| offset | Description |

The base address of config link table mode is RKVDEC_BASE+0x100.

#### 5.4.4.2VDPU381 Output Buffer Size Requested

We define variables ceilM(N) as follows:

ceil(M,N)=$ceilM(N) = ((N + M - 1) / M) * M$

(1). Output frame decoder buffer size

If output select YCbCr 4:2:0 semi-planar raster-scan format, you can use follows formula to calculate the decoder frame buffer size.

$$luma_frame_buffer_size = y_vir_hor_stride * pic_h * bit_depth_y / 8$$

$$chroma_frame_buffer_size = uv_vir_hor_stride * (pic_h / 2) * bit_depth_c / 8$$

$$frame_buffer_size = luma_frame_buffer_size + chroma_frame_buffer_size$$

There:

- y_vir_hor_stirde: The virtual stride of luma, it must should more bigger than picture width
- uv_vir_hor_stride: The virtual stride of chroma, it must should more big than picture width for YCbCr 4:2:0
- bit_depth_y/c: Main10 or main, its value will be 10 or 8

Second, if FBC format be selected, you can use follows formula to calculate the decoder frame buffer size.

fbc_head_buffer_size = vir_hor_fbc_head*(ceil64(pic_h)+16)/16
payload_buffer_size = celi64(pic_w)*(ceil64(pic_h)+16)*pixel_byte_num
max_fbc_buffer_size = fbc_head_buffer_size + payload_buffaer_size

There:

- vir_hor_fbc_head:the horizontal virtual stride of fbc head, its valud should more bigger than $ceil64(pic_w)/16$.
- pixel_byte_num: yuv400 and yuv444 is 3xbitdepth/8; yuv420 is 1.5xbitdepth/8; yuv422 is 2xbitdepth/8

But payload real buffer size space used will less than payload_buffer_size, it will according to FBC compress rate.

(2). Output frame colmv buffer size

If colmv compress be disabled, you can use follows formula to calculate the decoder frame buffer size.

Table 5-12 Colmv uncompress info

| Format | Colmv_size | Colmv space(bytes unit) |
|---|---|---|
| h264 | 4x4 | 8 |
| hevc | 16x16 | 16 |
| vp9 | 8x8 | 16 |
| avs2 | 16x16 | 8 |

So, the colmv uncompress size is:

Rockchip Confidencial

$$colmv_buffer_size0 = (ceil64(pic_w) * ceil64(pic_h) / (colmv_size * colmv_size)) * colmv_bytes$$

The buffer size unit is byte unit.

If colmv compress be active, you can use follows formula to calculate the decoder frame buffer size.

segment_w = (64 * colmv_size * colmv_size) / ctu_size

segment_h = ctu_size

pic_w_align = ceil(pic_w, segment_w)

pic_h_align = ceil(pic_h, segment_h)

seg_cnt_w=pic_w_align/segment_w

seg_cnt_h=pic_h_align/segment_h

segment_head_line_size=ceil(seg_cnt_w,16)

seg_head_size=segment_head_line_size*seg_cnt_h

seg_payload_size=seg_cnt_w*seg_cnt_h*64*colmv_bytes

colmv_compress_size=seg_head_size+seg_payload_size

where:

- ctu_size: ctu size;
- colmv_size: the block size for each colmv
- colmv_bytes: each colmv space used

(3). Error info buffer size

If error infomation be enable write to DDR, the error info buffer size will be required, and we can use the follows formula to calculate the error info buffer size.

$$error_info_buffer_size = ceil2(slice_num) * 8$$

only h264 and h265 support error info output.

#### 5.4.4.3 VDPU381 Decoder temporary Buffer Size Requested

The temporary buffer only used when VDPU346 on working status.The data write to temporary buffer size is row and col buffer data, we suggest row buffer used internal sram buffer will enhance the decoder performance.

Row buffer and Col buffer size require are listed as fellows.

Table 5-13 Row or Col buffer size required

| data type | required condtion | buffer size |
|---|---|---|
| STRMD Row | H.265/H.264/VP9/AVS2 | 3*pic_width |
| Inter Row | H.265/H.264/VP9/AVS2 | 6*pic_width |
| Inter Col | H.265/H.264/VP9/AVS2 | 3*pic_height |
| Transd Row | H.265/H.264/VP9/AVS2 | 0.4* pic_width |
| Transd col | H.265/H.264/VP9/AVS2 | 0.1* pic_height |
| Recon Row | H.265/H.264/VP9/AVS2 | 6*pic_width |
| Dblk Row | H.265/H.264/VP9/AVS2 | 22*pic_width |
| Sao Row | H.265/H.264/VP9/AVS2 | 6*pic_width |
| FBC Row | H.265/H.264/VP9/AVS2 | 11*pic_width |
| Filterd Col | H.265/VP9, have col tile | 67* pic_height |

### 5.4.5 VDPU720 feature supported

1. JPEG Decoder

JPEG features supported by decoder are as shown in **Error! Reference source not found.**.

Table 5-14 JPEG features

| Feature | Decoder support |
|---|---|
| Input data format | JFIF file format 1.02<br>YCbCr 4:0:0, 4:2:0, 4:2:2, 4:4:0, 4:1:1 and 4:4:4 semi-planar |
| Decoding scheme | frame by frame |
| Output data format | YCbCr 4:0:0, 4:2:0, 4:2:2, 4:4:0, 4:1:1 and 4:4:4 semi-planar |
| Supported image size | 48x48 to 65536x65536(4295Mpixels) |

Rockchip Confidencial

| Feature | Decoder support |
|---|---|
| | Step size 8 pixels |
| Maximum frame rate | Up to 560 million pixels per second |
| Thumbnail decoding | JPEG compressed thumbnails supported |
| Restart marker frequency decoding | Supported |
| MJPEG | Supported |
| Error detection | Supported |

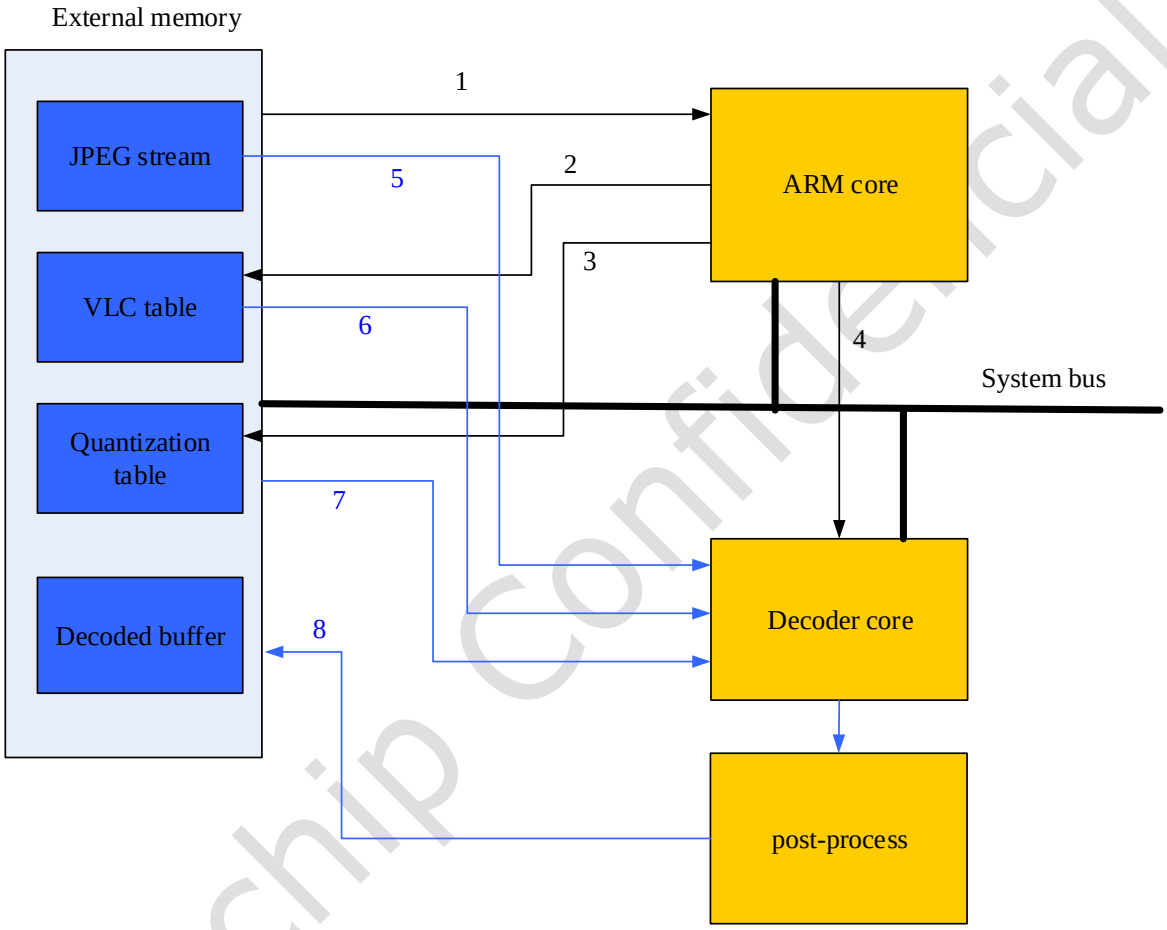

Fig. 5-11 The dataflow of JPEG decoder and post-processor

The data flow of jpeg decoder is as Fig. 5-11 The dataflow of JPEG decoder and post-processor
shown. The decoder software starts decoding the picture by parsing the stream headers (1) and then writes the following items to external memory:
VLC tables (2)
Quantization tables (3)
Last step for the software is to write the hardware control registers and to enable the hardware (4). After starting hardware, SW waits interrupt from HW.
Hardware decodes the picture by reading stream (5), VLC (6) and QP (7) tables. Hardware writes the decoded output picture memory one macroblock at a time (8). When the picture has been fully decoded, or the hardware has run out of stream data, it gives an interrupt with a proper status flag and provides stream end address for software to continue and returns to initial state.
The follow image post-processor only support combined mode.

2. Image Post-processor
The features supported by Post-processor are as show in **Error! Reference source not f**

Rockchip Confidential

**ound.**.

Table 5-15 Post-processor features

| Feature | Post-processor support |
|---|---|
| Input data format | Any format generated by the decoder in combined mode<br>YCbCr 4:2:0 semi-planar<br>YCbCr 4:2:0 planar<br>YCbYCr 4:2:2<br>YCrYCb 4:2:2<br>CbYCrY 4:2:2<br>CrYCbY 4:2:2 |
| Post-processor scheme | Frame by frame. Post-processor handles the image macroblock by macroblock. |
| Input image source | Internal source |
| Output data format | YCbCr 4:2:0 semi-planar<br>YCbCr 4:2:2<br>YCrYCb 4:2:2<br>CbYCrY 4:2:2<br>CrYCbY 4:2:2<br>Fully configurable RGB channel lengths and locations inside 24 bits, e.g. RGB 24-bit (8-8-8), RGB 16-bit(5-6-5). |
| Input image size | 48x48 to 65536x65536<br>Step size 8 pixels |
| Output image size | 16x16 to 65536x65536<br>Horizontal step size 1<br>Vertical step size 1 |
| Image down-scaling | Proprietary averaging filter<br>Arbitrary, integer scaling ratio separately for both dimensions<br>0/2/4/8 down-scaling ratio |
| YCbCr to RGB color conversion | BT.601 compliant<br>BT.709 compliant<br>User definable conversion coefficient |
| Dithering | 2x2 ordered spatial dithering for 4, 5 and 6 bit RGB channel precision |
| Output picture | support raster or tile mode picture out<br>luma 8x8 block tile |

In pipe-line mode, the post-processor works together with the multi-format decoder. The PP will take its input directly from the decoder. The dataflow is as Fig. 5-12 Post-process Dataflow
show.

Rockchip Confidencial

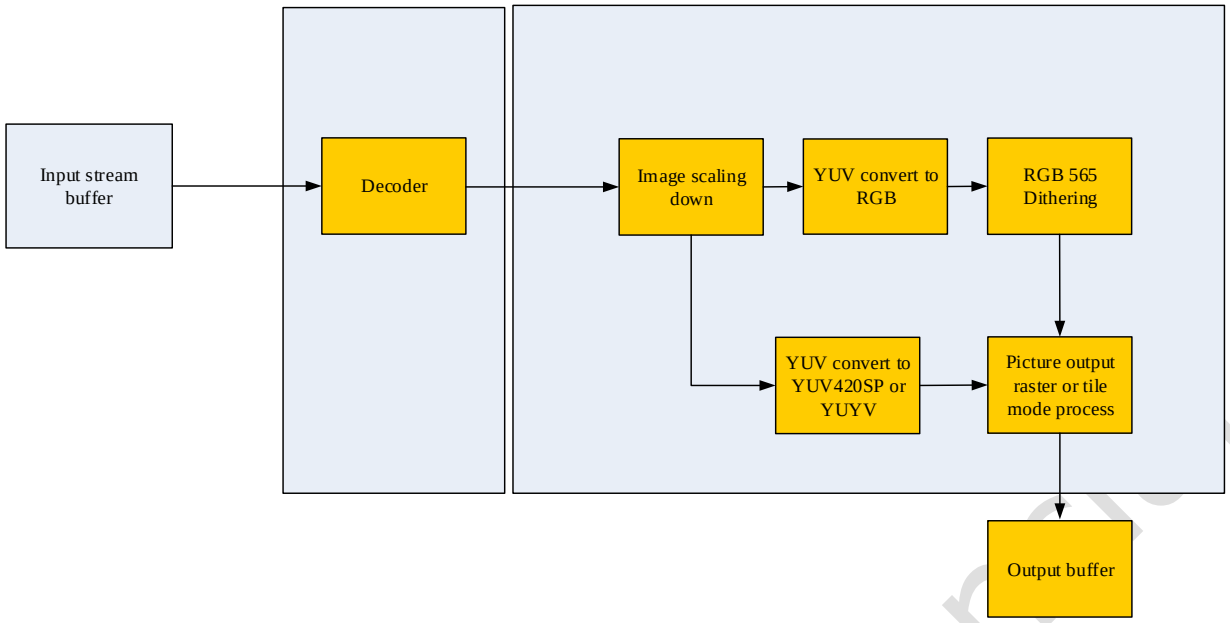

Fig. 5-12 Post-process Dataflow

## 5.4.6 VDPU981 feature supported

1.AV1

Table 5-16 Video H.265 decoder features

| Feature | Decoder support |
|---|---|
| Input data format | AV1 byte unit stream |
| Decoding scheme | Frame by frame |
| Output data format | YCbCr 4:2:0 Semi-Planar<br>FBC output format<br>YCbCr Tiled Semi-Planar |
| Supported image size | 64x64 to 7680x4320<br>step size 16pixels |
| Profile/level | Main<br>Main10<br>level 6.0 |
| Maximum frame rate | YCbCr 4:2:0 60fps @3840x2160 |
| Maximum bit rate | 240MBPS |

## 5.4.7 VEPU121 feature supported

1. JPEG encoder

The JPEG features supported by encoder are shown as follows.

Table 5-17 Video Jpeg encoder feature

| Feature | Encoder support |
|---|---|
| Input data format | YCbCr formats:<br>YCbCr 4:2:0 planar<br>YCbCr 4:2:0 semi-planar<br>YCbYCr 4:2:2①<br>CbYCrY 4:2:2 Interleaved①<br>RGB formats:①<br>RGB444 to BGR444<br>RGB555 to BGR555<br>RGB565 to BGR565<br>RGB888 to BRG888<br>RGB101010 and BRG 101010 |
| Output data format | JFIF FILE format 1.02<br>Non-progressive JPEG |
| Supported image size | 96x96 to 8192x8192(64 million pixels) |

Rockchip Confidential

| Feature | Encoder support |
|---|---|
| | Step size 4 pixels |
| Maximum Data rate | Up to 90 million pixels per second |

①internally encoder handles image only in 4:2:0 format

### 5.4.8 VEPU580 feature supported

Table 5-18 HEVC and H.264 encoder feature

| Feature | Decoder support |
|---|---|
| Input data format | YCbCr formats:<br>YCbCr 4:2:0 planar<br>YCbCr 4:2:0 semi-planar<br>YCbYCr 4:2:2<br>CbYCrY 4:2:2 Interleaved<br>Frame Buffer Compression<br>RGB formats:<br>RGB888<br>ARGB8888 |
| Decoding scheme | Frame by frame |
| Output data format | HEVC and H.264 Bit Stream |
| Supported image size | 64x64 to 16384x8192 |
| Maximum bit rate | 800Mbps |

## 5.5 Register Description

### 5.5.1 Internal Address Mapping

This section describes the control/status registers of the codec.
If VDPU121 decoder is chosen to work, the register base address is VDPU121_base.
If VDPU381 ccu is chosen to work, the register base address is VDPU381_CCU_base.
If VDPU381 core0 is chosen to work, the register base address is VDPU381_core0_base.
If VDPU381 core1 is chosen to work, the register base address is VDPU381_core1_base.
If VDPU720 decoder is chosen to work, the register base address is VDPU720_base.
If VDPU981 decoder is chosen to work, the register base address is VDPU981_base.
If VEPU121 core0 is chosen to work, the register base address is VEPU121_core0_base.
If VEPU121 core1 is chosen to work, the register base address is VEPU121_core1_base.
If VEPU121 core2 is chosen to work, the register base address is VEPU121_core2_base.
If VEPU121 core3 is chosen to work, the register base address is VEPU121_core3_base.
If VEPU121 core4 is chosen to work, the register base address is VEPU121_core4_base.
If VEPU580 core0 is chosen to work, the register base address is VEPU580_core0_base.
If VEPU580 core1 is chosen to work, the register base address is VEPU580_core1_base.
All the register config base are listed as follows:

Table 5-19 Base address of config

| Config Register | Base addr |
|---|---|
| VDPU121 function config base | VDPU121_base |
| VDPU121 mmu config base | VDPU121_base+0x400 |

## 5.5.8 VDPU121 MMU Detail Registers Description

### VCODEC_MMU_DTE_ADDR

Address: Operational Base + offset (0x0000)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:0 | RW | 0x00000000 | MMU_DTE_ADDR<br>MMU current page Table address |

### VCODEC_MMU_STATUS

Address: Operational Base + offset (0x0004)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:11 | RO | 0x000000 | Reserved |
| 10:6 | RO | 0x00 | PAGE_FAULT_BUS_ID<br>Index of master responsible for last page fault |
| 5 | RO | 0x0 | PAGE_FAULT_IS_WRITE<br>The direction of access for last page fault:<br>1'b0: Read<br>1'b1: Write |
| 4 | RO | 0x1 | REPLAY_BUFFER_EMPTY<br>1'b1:The MMU replay buffer is empty |
| 3 | RO | 0x1 | MMU_IDLE<br>The MMU is idle when accesses are being translated and there are no unfinished translated accesses.<br>1'b1: MMU is idle |
| 2 | RO | 0x0 | STAIL_ACTIVE<br>MMU stall mode currently enabled. The mode is enabled by command<br>1'b1: MMU is in stall active status |
| 1 | RO | 0x0 | PAGE_FAULT_ACTIVE<br>MMU page fault mode currently enabled. The mode is enabled by command.<br>1'b1: Page fault is active |
| 0 | RO | 0x0 | PAGING_ENABLED<br>1'b0: Paging is disabled<br>1'b1: Paging is enabled |

### VCODEC_MMU_COMMAND

Rockchip Confidencial

Address: Operational Base + offset (0x0008)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:3 | RO | 0x00000000 | Reserved |
| 2:0 | WO | 0x0 | MMU_CMD<br>MMU_CMD. This can be:<br>3'd0: MMU_ENABLE_PAGING<br>3'd1: MMU_DISABLE_PAGING<br>3'd2: MMU_ENABLE_STALL<br>3'd3: MMU_DISABLE_STALL<br>3'd4: MMU_ZAP_CACHE<br>3'd5: MMU_PAGE_FAULT_DONE<br>3'd6: MMU_FORCE_RESET |

**VCODEC_MMU_PAGE_FAULT_ADDR**

Address: Operational Base + offset (0x000c)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:0 | RO | 0x00000000 | PAGE_FAULT_ADDR<br>Address of last page fault |

**VCODEC_MMU_ZAP_ONE_LINE**

Address: Operational Base + offset (0x0010)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:0 | WO | 0x00000000 | MMU_ZAP_ONE_LINE<br>ddress to be invalidated from the page table cache |

**VCODEC_MMU_INT_RAWSTAT**

Address: Operational Base + offset (0x0014)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:2 | RO | 0x00000000 | Reserved |
| 1 | RW | 0x0 | READ_BUS_ERROR<br>Read bus error status |
| 0 | RW | 0x0 | PAGE_FAULT<br>Page fault status |

**VCODEC_MMU_INT_CLEAR**

Address: Operational Base + offset (0x0018)

Rockchip Confidencial

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:2 | RO | 0x00000000 | Reserved |
| 1 | WO | 0x0 | READ_BUS_ERROR<br>Write 1 to clear read bus error |
| 0 | WO | 0x0 | PAGE_FAULT<br>Write 1 to page fault clear |

**VCODEC_MMU_INT_MASK**

Address: Operational Base + offset (0x001c)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:2 | RO | 0x00000000 | Reserved |
| 1 | RW | 0x0 | READ_BUS_ERROR<br>Enable the read bus interrupt source when this bit is set to 1'b1 |
| 0 | RW | 0x0 | PAGE_FAULT<br>Enable the page fault interrupt source when this bit is set to 1'b1 |

**VCODEC_MMU_INT_STATUS**

Address: Operational Base + offset (0x0020)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:2 | RO | 0x00000000 | Reserved |
| 1 | RO | 0x0 | READ_BUS_ERROR<br>1'b1: Read bus error status |
| 0 | RO | 0x0 | PAGE_FAULT<br>1'b1: Page fault |

**VCODEC_MMU_AUTO_GATING**

Address: Operational Base + offset (0x0024)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:1 | RO | 0x00000000 | Reserved |
| 0 | RW | 0x1 | Mmu_auto_clkgating<br>When it is 1'b1, the mmu will auto gating it self |

## 5.5.9 VDPU381 Registers Summary

Rockchip Confidencial

| Name | Offset | Size | Reset Value | Description |
|---|---|---|---|---|
| RKVDEC_SWREG0_ID | 0x0000 | W | 0x00000000 | ID register (read only) |
| RKVDEC_SWREG8_IN_OUT | 0x0020 | W | 0x00000000 | Data input and output endian setting and sys ctrl. |
| RKVDEC_SWREG9_DEC_MODE | 0x0024 | W | 0x00000000 | Dec mode |
| RKVDEC_SWREG10_DEC_E | 0x0028 | W | 0x00000000 | Decoder enable |
| RKVDEC_SWREG11_IMPORTANT_EN | 0x002c | W | 0x00000000 | Interrupt and decoder enable register. |
| RKVDEC_SWREG12_SENCODARY_EN | 0x0030 | W | 0x00000000 | Sys ctrl |
| RKVDEC_SWREG13_EN_MODE_SET | 0x0034 | W | 0x00000000 | Enable register. |
| RKVDEC_SWREG14_FBC_PARAM_SET | 0x0038 | W | 0x00000000 | Fbc parem set. |
| RKVDEC_SWREG15_STREAM_PARAM_SET | 0x003c | W | 0x00000000 | Stream param set |
| RKVDEC_SWREG16_STREAM_LEN | 0x0040 | W | 0x00000000 | Amount of stream bytes in the input buffer or amount ot rlc bytes in the input buffer. |
| RKVDEC_SWREG17_SLICE_NUMBER | 0x0044 | W | 0x00000000 | The current frame slice number |
| RKVDEC_SWREG18_Y_HOR_STRIDE | 0x0048 | W | 0x00000000 | Picture horizontal virtual stride. |
| RKVDEC_SWREG19_UV_HOR_STRIDE | 0x004c | W | 0x00000000 | Picture parametes |
| RKVDEC_SWREG20_FBC_PAYLOAD_OFFSET | 0x0050 | W | 0x00000000 | Register0004 Description |
| RKVDEC_SWREG20_Y_STRIDE | 0x0050 | W | 0x00000000 | The output picture y fac virtual stride.Suggest this register to config to even for advance ddr performance. |
| RKVDEC_SWREG21_ERROR_CTRL_SET | 0x0054 | W | 0x00000000 | Error sys ctrl |
| RKVDEC_SWREG22_ERR_ROI_CTU_OFFSET_START | 0x0058 | W | 0x00000000 | It will cal the error ctu num in the roi.It will include the st ctu and end ctu. |
| RKVDEC_SWREG23_ERR_ROI_CTU_OFFSET_END | 0x005c | W | 0x00000000 | It will cal the error ctu num in the roi.It will include the st ctu and end ctu. |
| RKVDEC_SWREG24_CABAC_ERROR_EN_LOWBITS | 0x0060 | W | 0x00000000 | Cabac error enable config. |
| RKVDEC_SWREG25_CABAC_ERROR_EN_HIGHBITS | 0x0064 | W | 0x00000000 | Cabac error enable high bits config. |

Rockchip Confidential

| Name | Offset | Size | Reset Value | Description |
|---|---|---|---|---|
| RKVDEC_SWREG26_BLOCK_GATING_EN | 0x0068 | W | 0x00000000 | Block gating enable ctrl flag. |

# 5.6 Application Notes

## 5.6.1 MMU Config Flow

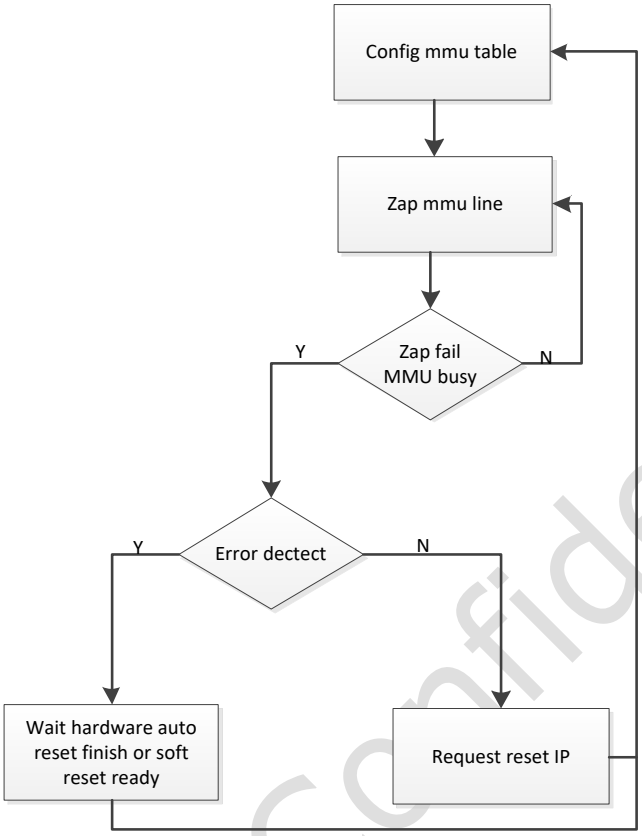

Fig. 5-13 MMU config flow

1. Prepare mmu table to ddr and config DTE address before begin to decoder.
2. If the mmu table have been changed, you will zap one mmu line.
3. If you zap successed, you can continus to zap next line.
4. If you zap fail, maybe some error happened, then you should check if there any error happen when decoding.
5. If some error happen, you should wait reset finish, and then re-start mmu config.
6. If don't have any error find, it will still need to reset, and then re-start mmu config.

## 5.6.2 VDPU121 decoder Configuration flow

1. Prepare the decoder data in the DDR memory, and in decoder other than JPEG decoder, the input stream buffer should at least contain a slice or a frame data, otherwise the decoder will produce an interrupt and show error and then reset itself.
2. Config all the registers will be used. The decoder can support ref buffer mode or cacheable mode, but they can't be both enabled. We can config the swreg57[28], swreg57[29] to enable cache and config the swreg65 to control the ref buffer.
3. You should config VDPU_SWREG57[0] as 1'b1 to enable video decoder. And config VDPU_SWREG41[0] as 1'b1 to enable pp. If pp performed in pipeline with decoder, you should config VDPU_SWREG41[4] as 1'b1 and then config VDPU_SWREG57[0] as 1'b1 to enable decoder and pp.
4. Wait for the frame interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~4 to start a new frame decoder or encoder.

Rockchip Confidencial

### 5.6.3 VDPU381 decoder Configuration Flow

1. Prepare the data in the DDR.
2. Set the H265 general system configuration. such as working mode in RKVDEC.swreg9, in/out endian in RKVDEC.swreg8.
3. Set the picture parameters with RKVDEC.swreg0~ RKVDEC.swreg63.
4. Set the input and output data base address and H265 reference configuration with RKVDEC.swreg64~ RKVDEC.swreg127.
5. If CABAC error detection is desired, set the RKVDEC.swreg21 to enable the corresponding error detection.
6. Set the interrupt configuration with RKVDEC.swreg11 and start the H265 with RKVDEC.swreg10.
7. Wait for the frame interrupt, and then get the processed results in the target DDR.
8. Clear all the interrupts, and repeat Process2~Process8 to start a new frame decoding if the decoding is not finished yet.

### 5.6.4 VDPU381 Link table Pointer mode configuration flow

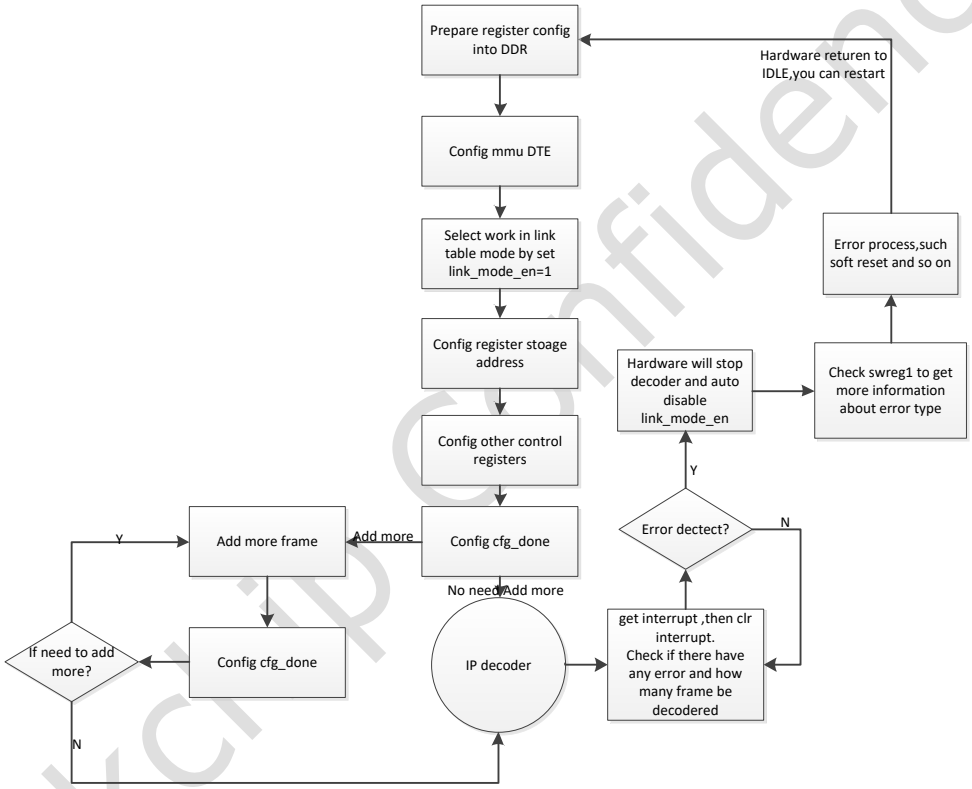

Fig. 5-14 Link table mode work flow

1. Prepare all the register config value into DDR.
2. Config mmu DTE and enable mmu before config link table mode.
3. Config link_mode_irq and other link table mode register. The register is from link_tale_swreg0~link_table_swreg2.
4. Config config_done(set link_table_swreg3[0]=1'b1) to make the link table register configuration effect, after that, hardware will begin to decoder frame by frame.
5. If you need to add more frame, you can use superaddition mode, you can add more frame when decoder at any status.
6. If all config be rdy, you should enable the working flag by config link_mode_en (link_table_swreg6[0]) to 1.
7. If all the frame be decodered, the hardware will hold the working status wait user to process, you can add more frame or set link_mode_en=0(need to set config_done=1'b1) to finish link table mode.
8. When you get interrupt, at first, you should clear the irq, and then, goto check if there

Rockchip Confidencial

have any error by check link_table_swreg4[31]=1'b1 or not. If any error found by hardware, the hardware will disable link table mode and stop decoder until user restart next link table mode. And then you can get more information about error type from normal register swreg225.
9. When you get interrupt, if there doesn't have any error, you may be to check the frame number which have been decoded.
10. Please note that: Any link table register be config, you need to config swreg3[0]=1'b1 to make it effective.

### 5.6.5 VDPU381 CCU configuration flow

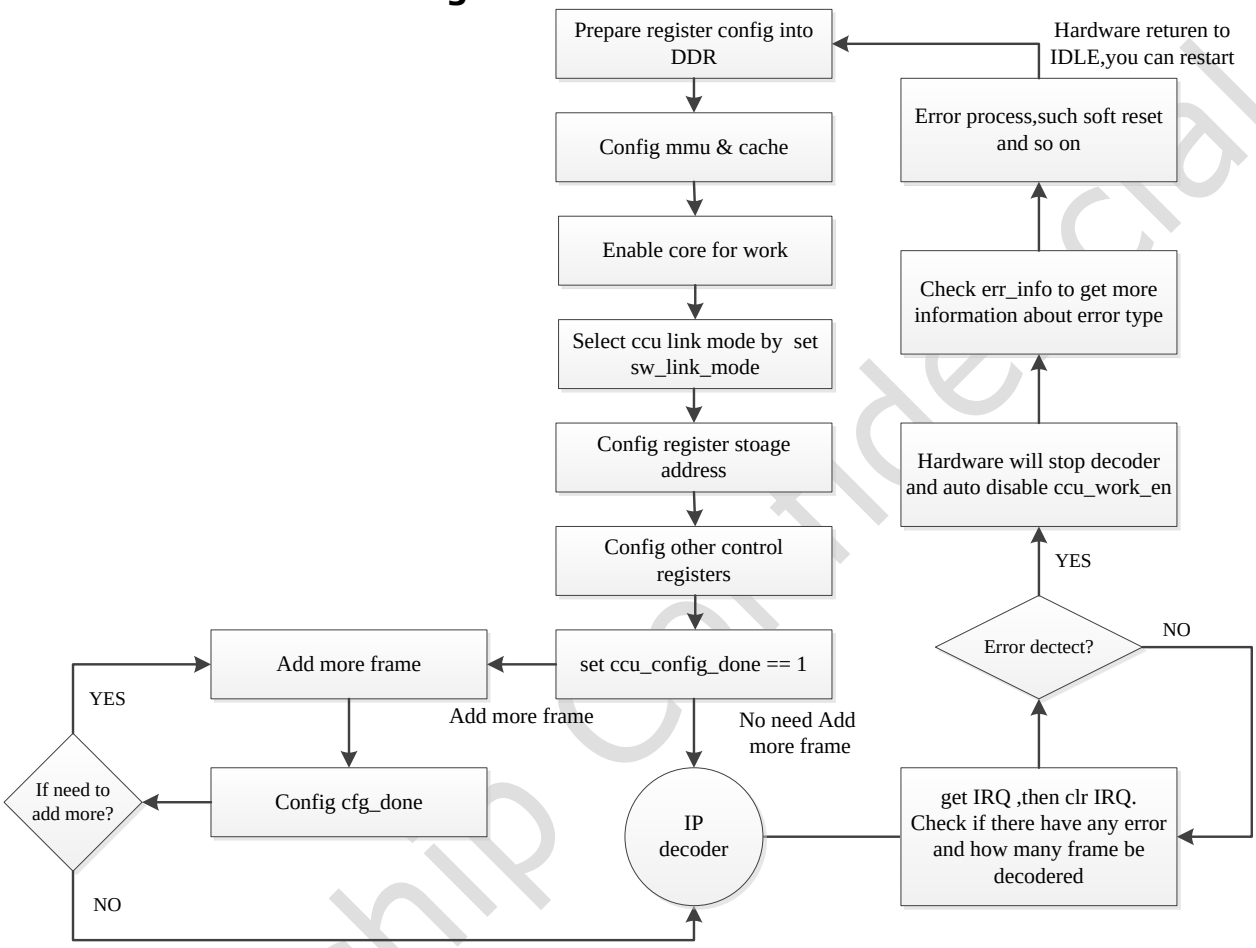

Fig. 5-15 Ccu mode work flow

1. Prepare all the register config value into DDR.
2. Config mmu&cache and enable mmu&cache before config sw_link_mode.
3. Select which cores work control by CCU, and enable these core by set resister (RKVDEC_BASE+0x0000
4. Config ccu_link_mode, ccu_cfg_start_addr and other ccu config resister
5. If all config be rdy, you should enable the working flag by config ccu_work_en set swreg6_ccu_work_en[0]=1'b1
6. Config ccu_config_done(set swreg3_ccu_config_down[0]=1'b1) to enble ccu configuration effect, after that, hardware will begin to decoder frame by frame.
7. If you need to add more frame, you can use superaddition mode, you can add more frame when decoder at any status.
8. If all the frame be decodered, the hardware will hold the working status wait user to process, you can add more frame or set sw_link_mode =0 to finish link table mode.
9.When you get interrupt, at first, you should clear the irq, and then, goto check if there have any error by check swreg21_ccu_core_err_sta[1:0]=2'b0 or not. If any error found by hardware core, the error hardware core will disable itself, and if all selection hareward core error, ccu stop decoder until user restart next ccu_mode.
10. When you get interrupt, if there doesn't have any error, you may be to check the frame

Rockchip Confidential

number which have been decoded.
11. Please note that: Any link table register be config, you need to config ccu_config_done =1'b1 to make it effective.

### 5.6.6 VDPU720 JPEG decoder Configuration flow

1. Prepare the decoder data in the DDR memory, and in decoder other than JPEG decoder, the input stream buffer should at least contain a slice or a frame data, otherwise the decoder will produce an interrupt and show error and then reset itself.
2. Config all the registers will be used.
3. You should config VDPU720_SWREG1[0] as 1'b1 to enable JPEG decoder.
4. Wait for the frame interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~4 to start a new frame decoder or encoder.

### 5.6.7 VEPU121 JPEG encoder Configuration flow

1. Prepare the encoder data in the DDR memory
2. Config all the registers will be used. And please notice that which be list as follows:
   - For encoder: We can configure the registers to control the input picture data format (such as endian and swap), but some input data format are fixed, such as cabac_table data. And the register VEPU_SWREG0~31 are JPEG quantization registers. They are write only registers. When you want to write these registers, you should first set VEPU_SWREG103[0] to 1'b0 and VEPU_SWREG103[5:4] to 2'b10( select JPEG mode).
3. VEPU_SWREG103[0] set to 1'b1 to enable encoder.
4. Wait for the frame interrupt, and then check if the frame decoder ready interrupt is right or not, after that, you can get the processed results in the target DDR.
5. Clear all the interrupts, repeat step 2~5 to start a new frame decoder or encoder.

### 5.6.8 VEPU580 Application Notes

## 5.6.8.1 VEPU Working Mode

VEPU supports two working modes: Register Configuration Mode and Link Table Mode.

In Register Configuration Mode, encoding a frame needs to be divided into three steps: Configure encoding parameters, start encoding, and then wait for enocoding finish. Configuration register and interrupt response time will reduce the encoding speed, but software can adjust the configuration of the next frame in real time accoding to the encoding result of the previous frame.

In Link Table Mode, User can store several frames' configurations in DDR before encoding or add new frames to be encoded while VEPU is processing the previous one. This will save the time of interrupt response and register configuration and let VEPU and software process in parallel.

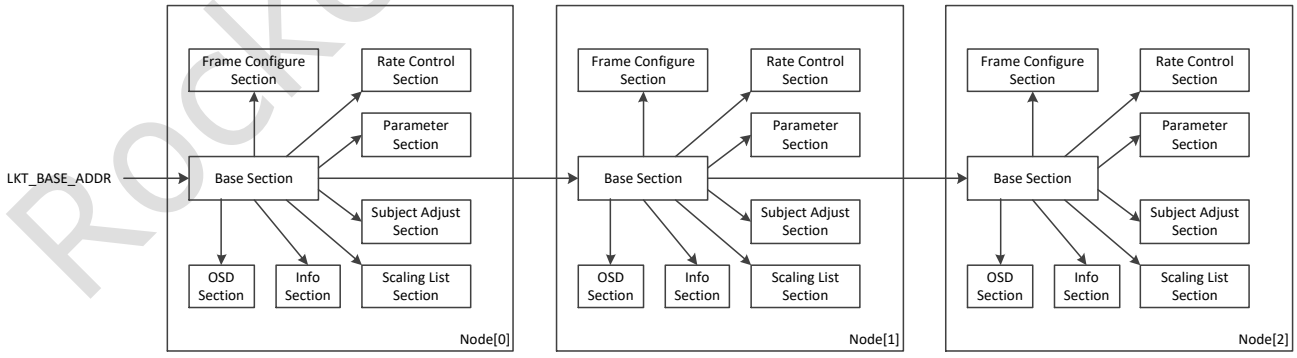

Fig. 5-16 VEPU mode mode

All the configurations for each frame encoding are organized into a Node, and the configurations in each Node are classified into different sections. There're 7 sections for each Nodes:

- Base Section: Contains the information of other sections for current Node and Base Section of the next node, including whether it is valid and the starting address.
- Frame Configure Section: Contains the base frame configurations.

Rockchip Confidential

- Rate Control Section: Contains the configurations for Rate Control.
- Parameter Section: Contains the configurations of optional parameters.
- Subjective Adjust Section: Contains the configurations for subjective Quality Adjustment.
- Scaling List Section: Contains the configurations for User Defined Scaling List.
- OSD Section: Contains the configurations for OSD application.
- Info Section: Contains the encoding informations sent out by VEPU.

Table 5-20 Link Table Node Section mapping and size

| Section | Size | Corresponding Register Address Offset |
|---|---|---|
| Base Section | 48 bytes | 0x0030~0x0058 |
| Frame Configure Section | 384 bytes | 0x0280~0x03f8 |
| Rate Control Section | 224 bytes | 0x1000~0x10e0 |
| Parameter Section | 1504 bytes | 0x1700~0x1cd4 |
| Subjective Adjust Section | 496 bytes | 0x2000~0x21e4 |
| Scaling List Section | 2720 bytes | 0x2200~0x2c98 |
| OSD Section | 1152 bytes | 0x3000~0x347c |
| Info Section | 32 bytes | 0x4000~0x401c |

## 5.6.8.2 VEPU Buffer Allocation

User should allocate the following buffers and informs VEPU before the corresponding frame encoding starts.

- Video Source Buffers: They store the encoded frame data and contain 1 to 3 buffers accoding to different color formats.
- Down Sampled Frame buffers: They store the Down Sampled Frame data for coarse ME, one for current frame if it will be referred while another for the reference frame if current frame contains P slice.
- Reconstruction Frame Buffers: One for current frame if it will be referred by other frames, and another for the reference frame if current frame contains P slice.
- Collocated MV buffers: One for current frame if it will be referred as col-Pic, and another for collocated picture if current frame contains P slice.
- Line Buffer: VEPU uses external space as linebuffer when the width of encoded frame or TILE is greater than 4K.
- TILE Buffer: It contains TILE boundary informations for cross TILE loop filter and frame buffer compression.
- Bitstream Buffer: VEPU stores encoded bitstreams in Bitstream Buffer.
- Motion Information Buffer: VEPU can output ME results for user expanded application.
- Link Table Buffers and ROI Buffers: described in corresponding function chapers.

### 5.6.8.2.1 Video Srouce Buffers

Depending on different video source format, there're up to 3 buffers should be allocated:

- VSBUF0: start address is configured by VEPU_ADR_SRC0
- VSBUF1: start address is configured by VEPU_ADR_SRC1
- VSBUF2: start address is configured by VEPU_ADR_SRC2

Table 5-21 Video Source Buffer allocation

| Color format | Data format | VSBUF0 | VSBUF1 | VSBUF2 |
|---|---|---|---|---|
| YUV444 8bit | YUV444 | ALL | | |
| YUV422 8bit | YUYV | ALL | | |
| | YUV422 Planar | Y | U | V |
| | YUV422 Semi-Planar | Y | U+V | |
| | Frame Buffer Compression | Header | Body | |
| YUV420 8bit | YUV420 Planar | Y | U | V |
| | YUV420 Semi-Planar | Y | U+V | |
| | Frame Buffer Compression | Header | Body | |
| YUV400 8bit | YUV400 | Y | | |
| RGB | ARGB8888 | ALL | | |

Rockchip Confidencial

| Color format | Data format | VSBUF0 | VSBUF1 | VSBUF2 |
|---|---|---|---|---|
| | RGB888 | ALL | | |
| | RGB565 | ALL | | |

#### 5.6.8.2.2 Down Sampled Frame Buffers

Down-sampled frame buffer is for VEPU coarse motion estimation. If current frame will be referred in subsequent encoding, the down-sampled current frame buffer should be allocated with the start address of VEPU_ADR_DSPW. If current frame is P frame, a reference frame buffer should be selected and set the start address to VEPU_ADR_DSPR.
The size of Down Sampled Frame Buffer is:
((VEPU_ENC_RSL.pic_wd8_m1+8)/8) x (VEPU_ENC_RSL.pic_hd8_m1+2)/2) x 64Bytes.
Note that the start address of Down Sampled Frame Buffer should be 1KB aligned.

#### 5.6.8.2.3 Reconstruction Frame Buffers

Reconstruction Frame Buffer store the reconstructed frame data for motion estimation. Because Frame Buffer Compression is implemented, each frame buffer has a head portion and a body portion. VEPU_ADR_RFPW_H and VEPU_ADR_RFPW_B should be set to the head portion and body portion start address of current frame buffer separately.
VEPU_ADR_RFPR_H and VEPU_ADR_RFPR_B should be set to the header portion and body portion start address of reference frame buffer.
The size of head portion of current and reference frame buffer is:
(((VEPU_ENC_RSL.pic_wd8_m1+2)/2) x ((VEPU_ENC_RSL.pic_hd8_m1+1)x2) +15)/16 x 16Bytes.
The size of body portion of current and reference frame buffer is:
((VEPU_ENC_RSL.pic_wd8_m1+2)/2) x ((VEPU_ENC_RSL.pic_hd8_m1+1)x2) x 96Bytes.
Note that the head and body start address should be 4K bytes aligned.

#### 5.6.8.2.4 Collocated Mv Buffers

Collocated Mv Buffers store the col-mv information for HEVC encoding.
When VEPU_ME_CFG.colmv_stor is 1, VEPU will store the col-mv information of current encoding frame into the Collocated Mv Buffer with the start address of VEPU_ADR_CMVW.
When VEPU_ME_CFG.colmv_load is 1, VEPU will load the col-mv information from the Collocated Mv Bufffer with the start address of VEPU_ADR_CMVR.
The size of Collocated Mv Buffer is calculated by the following function:
((VEPU_ENC_RSL.pic_wd8_m1+8)/8) x ((VEPU_ENC_RSL.pic_hd8_m1+8)/8) x 32Bytes.
Note that the start address should be 1K bytes aligned.

#### 5.6.8.2.5 Line Buffer

VEPU uses external memory space as line buffer when the width of encoded TILE or frame is bigger than 4K. The size of Line Buffer is: (VEPU_ENC_RSL.pic_wd8_m1+8)/8) x 480 Bytes.

#### 5.6.8.2.6 TILE Buffer

VEPU stores the Loop Filter and Frame Buffer Compression Information of the right TILE boundary and load it of the left side. Note that VEPU does not store if current TILE is the rightmost one of the frame, and does not load if current TILE is the leftmost one.
The size of TILE Buffer is: (VEPU_TLIE_CFG_HEVC.tile_h_m+1) x 128 x 16 Bytes

#### 5.6.8.2.7 Bitstream Buffer

VEPU stores the encoding result (bit stream) into bit stream buffer.
There are 4 address pointers for one bit stream buffer management:

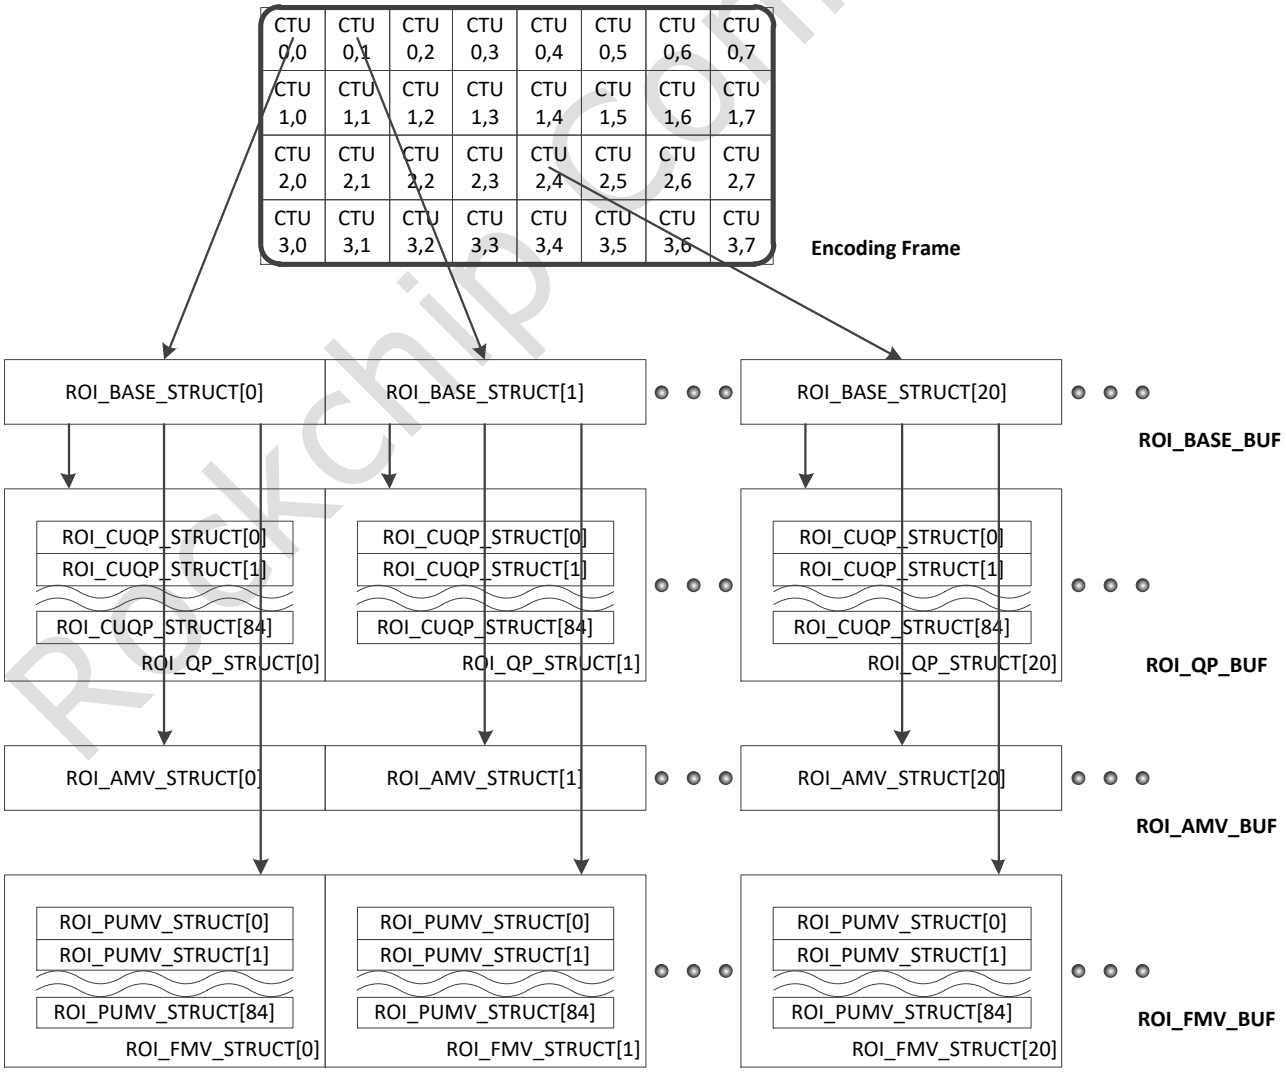
- VEPU_ADR_BSBT: top address, not included.
- VEPU_ADR_BSBB: bottom address, included.
- VEPU_ADR_BSBR: read address to avoid overlap.
- VEPU_ADR_BSBW: write start address.

Two types of buffer management strategy can be implemented by configuring the four address pointers: single buffer and cyclic buffer management.
Single buffer management allocates a new buffer for each frame while cyclic buffer management allocates a shared cyclic buffer for all encoding frames.
Interrupt VEPU_INT_STUS.bs_ovflr will assert when write address meets read address

Rockchip Confidential

(which indicates buffer is full) and encoding process is paused. Driver should allocated a new buffer to continue current frame encoding by setting new values to the four address pointers or change buffer read address (read out the bitstream before that), and then the encoding process will continue.
Note that VEPU_ADR_BSBW must be configured after the other 3 address pointers.

#### 5.6.8.2.8 Motion Information Buffer



When VEPU_ENC_PIC.mei_stor is 1, the Motion Information Buffer should be allocated with the start address of VEPU_ADR_MEIW. VEPU stores best motion vector and corresponding SAD into this buffer just for user extended extraction.
The size of Motion Information Buffer is:
((VEPU_ENC_RSL.pic_wd8_m1+32)/32) x (VEPU_ENC_RSL.pic_hd8_m1+1)x2) x 64Bytes.

### 5.6.8.3 VEPU ROI Application

VEPU supports block mapping ROI configuration. Each CTU(for HEVC) or MB(for H.264) can be configured by the corresponding structs stored in ROI_BASE_BUF, which is called ROI_BASE_STRUCT.
The ROI_BASE_STRUCT contains the base configuration for each CTU or MB, and the switches for 3 extended ROI configuration structs: ROI_QP_STRUCT, ROI_AMV_STRUCT and ROI_FMV_STRUCT.

#### 5.6.8.3.1 ROI configuration for HEVC

User can specify partition, prediction mode, QP, and Mvs of each CTU though HEVC ROI configuration. The ROI configuration stucts and mapping relations are shown in the figure below.

Rockchip Confidential

Fig. 5-17 HEVC ROI configuration summary

Each CTU has its corresponding ROI_BASE_STRUCT stored in ROI_BASE_BUF, it contains the basic ROI configurations as listed in the table below.

Table 5-22 ROI_BASE_STRUCT for HEVC

| Bit | Field | Description |
|---|---|---|
| 511 | amv_en | Area Mv enable. VEPU will get AMV from ROI_AMV STRUCT if this field is 1. |
| 510 | Reserved | |
| 509:425 | qp_adj[85] | QP adjustment enable. VEPU will get the QP adjustment from ROI_QP_STRUCT if the corresponding bit is 1.<br>qp_adj[85]: adjust the QP of CU64<br>qp_adj[83:80]: adjust the QP of CU32[3~0]<br>qp_adj[79:64]: adjust the QP of CU16[15~0]<br>qp_adj[63:0] : adjust the QP of CU8[63~0] |
| 424:340 | force_split[85] | Force CU split if the corresponding bit is 1.<br>force_split[85]: force split of CU64<br>force_split[83:80]: force split of CU32[3~0]<br>force_split[79:64]: force split of CU16[15~0]<br>force_split[63:0]: reserved |
| 339:170 | force_intra[85][1:0] | CU will be encoded as INTRA if the corresponding section is 1. (each section has 2 bits, values of 2 and 3 are reserved)<br>force_intra[85][1:0]: force intra of CU64<br>force_intra[83:80][1:0]: force intra of CU32[3~0]<br>force_intra[79:64][1:0]: force intra of CU16[15~0]<br>force_intra[63:0][1:0]: force itnra of CU8[63:0] |
| 169:0 | force_inter[85][1:0] | CU will be encoded as INTER with Mv(0,0) if corresponding section is 2; with the Mv assigned by ROI_FMV_STRUCT if corresponding section is 3. (value of 1 is reserved).<br>force_inter[85][1:0]: force inter of CU64<br>force_inter[83:80][1:0]: force inter of CU32[3~0]<br>force_inter[79:64][1:0]: force inter of CU16[15~0]<br>force_inter[63:0][1:0]: force inter of CU8[63~0] |

Each CTU has its corresponding ROI_QP_STRUCT stored in ROI_QP_BUF, it contains 85 CUs' QP configurations which are called ROI_CUQP_STRUCT. Considering address alignment, spaces of 96 ROI_CUQP_STRUCT are allocated for each ROI_QP_STRUCT, and the high 11 of them are reserved. The definition of ROI_CUQP_STRUCT is listed in the table below.

Table 5-23 ROI_CUQP_SRUCT for HEVC

| Bit | Field | Description |
|---|---|---|
| 15 | adj_mode | QP adjustment mode.<br>0: relative QP adjuctment<br>1: absolute QP adjustment |
| 14:8 | qp_value | QP adjustment value. Two's complement. |
| 7:4 | qp_clip | The index of QP clipping, values from 0 to 7. |

Rockchip Confidential

| Bit | Field | Description |
|---|---|---|
| 3:0 | reserved | |

Each CTU has 1 ROI_AMV_STRUCT. It specifies a searh area for Motion Estimation.

Table 5-24 ROI ROI_AMV_STRUCT for HEVC

| Bit | Field | Description |
|---|---|---|
| 31:16 | amv_y | The vertical component of area Mv, with 1 pixel accuracy. |
| 15:0 | amv_x | The horizontal component of area Mv, with 1 pixel accuracy. |

Each CTU has 85 PUs and each PU has its own forced Mv configurations called ROI_PUMV_STRUCT. Considering address alignment, spaces of 96 ROI_PUMV_STRUCT are allocated for each ROI_FMV_STRUCT, and the high 11 of them are reserved. The definition of ROI_PUMV_STRUCT is listed in the table below.

Table 5-25 ROI ROI_PUMV_STRUCT for HEVC

| Bit | Field | Description |
|---|---|---|
| 31:16 | fmv_y | The vertical component of forced Mv, with 1/4 pixel accuracy. |
| 15:0 | fmv_x | The horizontal component of forced Mv, with 1/4 pixel accuracy. |

#### 5.6.8.3.2 ROI configuration for H.264

User can specify partition, encoding mode, QP, and Mvs of each MB though H.264 ROI configuration. The ROI configuration stucts and mapping relations are shown in the figure below. In particular, every 4 MBs share one ROI_AMV_STRUCT and one ROI_FMV_STRUCT.

Rockchip Confidential

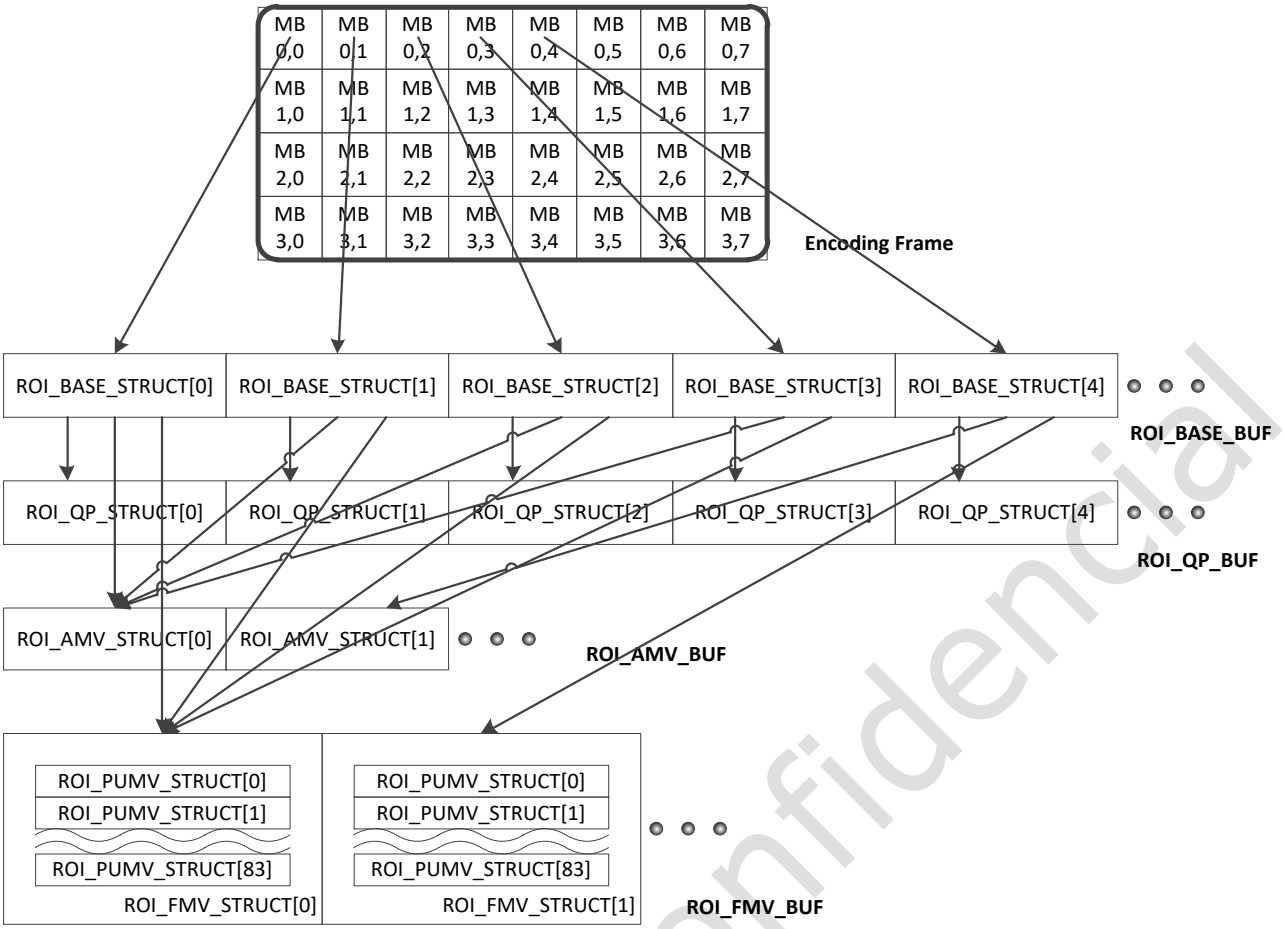


Fig. 5-18 H.264 ROI configuration summary

Each MB has its corresponding ROI_BASE_STRUCT stored in ROI_BASE_BUF, it contains the basic ROI configurations as listed in the table below.

Table 5-26 ROI_BASE_STRUCT for H.264

| Bit | Field | Description |
|---|---|---|
| 63 | amv_en | Area Mv enable. VEPU will get AMV from ROI_AMV_STRUCT if this field is 1. |
| 62 | qp_adj_en | QP adjustment enable. VEPU will load ROI_QP_STRUCT to get the QP adjustment configurations if ithis field is 1. |
| 61 | force_intra | Force Intra. MB will be encoded as INTRA if this field is 1. |
| 60:51 | reserved | |
| 50:42 | mode_mask[8:0] | Mode Mask. Disable the encoding mode if corresponding bit is 1.<br>mode_mask[8]: disable inter4x4<br>mode_mask[7]: disable intra4x4<br>mode_mask[6]: disable intra8x8<br>mode_mask[5]: disable intra16x16<br>mode_mask[4]: disable inter8x8 with T4<br>mode_mask[3]: disable inter8x8 with T8<br>mode_mask[2]: disable inter16x16 with T4<br>mode_mask[1]: disable inter16x16 with T8<br>mode_mask[0]: disable skip mode |

Rockchip Confidencial

| Bit | Field | Description |
|---|---|---|
| 41:0 | force_inter[21][1:0] | Partition will be encoded as INTER with Mv(0,0) if corresponding section is 2; with the Mv assigned by ROI_FMV_STRUCT if corresponding section is 3. (value of 1 is reserved).<br>force_inter[21][1:0]: force inter of 16x16 partition<br>force_inter[20:16][1:0]: force inter of 8x8 partition[3~0]<br>force_inter[15:0][1:0]: force inter of 4x4 partition[15~0] |

Each MB has its corresponding ROI_QP_STRUCT stored in ROI_QP_BUF, it contains the QP Adjustment Configurations as listed in the table below.

Table 5-27 ROI_QP_SRUCT for H.264

| Bit | Field | Description |
|---|---|---|
| 15 | adj_mode | QP adjustment mode.<br>0: relative QP adjuctment<br>1: absolute QP adjustment |
| 14:8 | qp_value | QP adjustment value. Two's complement. |
| 7:4 | qp_clip | The index of QP clipping, values from 0 to 7. |
| 3:0 | reserved | |

Every 4 MBs share one ROI_AMV_STRUCT. It specifies a searh area for Motion Estimation.

Table 5-28 ROI ROI_AMV_STRUCT for H.264

| Bit | Field | Description |
|---|---|---|
| 31:16 | amv_y | The vertical component of area Mv, with 1 pixel accuracy. |
| 15:0 | amv_x | The horizontal component of area Mv, with 1 pixel accuracy. |

Each 4 MBs have 84 PU Forced Mv configurations(each MB has 21 Mvs) called ROI_PUMV_STRUCT. Considering address alignment, spaces of 96 ROI_PUMV_STRUCT are allocated for each ROI_FMV_STRUCT, and the high 12 of them are reserved. The definition of ROI_PUMV_STRUCT is listed in the table below.

Table 5-29 ROI ROI_PUMV_STRUCT for H.264

# Chapter 6 General Register Files (GRF)

## 6.1 Overview

The general register file will be used to do static setting by software, which is composed of many registers for system control. The GRF is located at several addresses.

## 6.2 Function Description

The function of general register file is:

- GPIO IOMUX control
- GPIO PAD control
- Common system control
- Record the system state

Table 6-1 GRF Address Mapping Table

| Name | Address Base |

# 6.9 DDR_GRF Register Description

There are two DDR_GRF modules in RK3588, DDR01_GRF and DDR23_GRF. DDR01_GRF is for DDR channel 0 and 1. DDR23_GRF is for DDR channel 2 and 3. They have different base address. For DDR01_GRF, DDR_GRF_CHA_* refers to the registers that correspond to DDR channel 0, while DDR_GRF_CHB_* refers to the registers that correspond to DDR channel 1. For DDR23_GRF, DDR_GRF_CHA_* refers to the registers that correspond to DDR channel 2, while DDR_GRF_CHB_* refers to the registers that correspond to DDR channel 3. Register that doesn't have prefix DDR_GRF_CHA or DDR_GRF_CHB is shared by channel 0 and 1 or channel 2 and 3 separately.

## 6.9.1 Registers Summary

| Name | Offset | Size | Reset Value | Description |
|---|---|---|---|---|
| DDR_GRF_CHA_CON0 | 0x0000 | W | 0x00000040 | DDR CHA Control Register 0 |
| DDR_GRF_CHA_CON1 | 0x0004 | W | 0x00000080 | DDR CHA Control Register 1 |

## 6.16.2 Detail Registers Description

### USB_GRF_HOST0_CON0

Address: Operational Base + offset (0x0000)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:12 | RO | 0x0 | reserved |
| 11:6 | RW | 0x20 | host0_fladj_val_common<br>This feature adjusts any offset from the clock source that drives the macro-SOF counter. The macro-SOF cycle time (number of macro-SOF counter clock periods to generate a macro-SOF microframe length) is equal to 59488 plus this value. The default value is decimal 32, which gives an SOF cycle time of 60000 (each microframe has 60000 bit times).<br>Frame Length (decimal) FLADJ Value (decimal)<br>59488 0 (0x00)<br>59504 1 (0x01)<br>59520 2 (0x02)<br>... ...<br>59984 31 (0x1F)<br>60000 32 (0x20)<br>... ...<br>60496 63 (0x3F) |

Rockchip Confidential

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 5:0 | RW | 0x20 | host0_fladj_val<br>USBHOST fladj bit control.<br>This feature adjusts the frame length of the microframe per port. This value must be the same as that of host0_fladj_val_common, or the EHCI yields undefined results. |

**USB_GRF_HOST0_CON1**

Address: Operational Base + offset (0x0004)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:14 | RO | 0x0 | reserved |
| 13 | RW | 0x0 | host0_arb_pause<br>USBHOST ehci/ohci arbiter pause control.<br>1'b0: Disable<br>1'b1: Enable |
| 12 | RW | 0x0 | host0_ohci_susp_lgcy<br>OHCI Clock control signal<br>This is a static strap signal.<br>When tied HIGH and the USB port is owned by OHCI, the signal utmi_suspend_o_n reflects the status of the USB port. (suspend or not suspend). |
| 11 | RW | 0x0 | host0_ohci_cntsel<br>Count Select<br>Selects the counter value for simulation or real time for 1 ms.<br>1'b0: Count full 1 ms<br>1'b1: Simulation time |
| 10 | RW | 0x1 | host0_ohci_clkcktrst<br>Clear Clock Reset<br>Initial reset signal for the Digital Phase-Locked Loop (DPLL) block. This is needed only for simulation and can be tied to inactive in the real netlist. The duration of the reset in simulation must be the same as hreset_n. |
| 9 | RW | 0x0 | host0_app_prt_ovrcur<br>Port Overcurrent Indication from Application<br>When asserted by the application, the corresponding port enters Disable state. This signal controls both EHCI and OHCI controller port state machines. Depending on ownership of the port, the corresponding EHCI or OHCI controller generates an Overcurrent Detect interrupt. |
| 8 | RW | 0x0 | host0_autoppd_on_overcur_en<br>Auto Port Power Disable on Overcurrent<br>This strap signal enables automatic port power disable in the host controller. When this signal is active, if an over-current condition is detected on a powered port and PPC is 1, the PP bit in each affected port is automatically transitioned by the host controller from a 1 to 0, removing power from the port. |
| 7 | RW | 0x1 | host0_word_if<br>Word Interface<br>Selects the data width of the UTMI PHY interface.<br>1'b1: 16bit interface<br>1'b0: 8bit interface<br>Only 16bit used in this application. |

Rockchip Confidencial

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 6 | RW | 0x0 | host0_sim_mode<br>USB HOST0 simulation mode bit control<br>Not used in application. |
| 5 | RW | 0x1 | host0_incrx_en<br>Burst Alignment Enable<br>Forces AHB master to start INCR4/8/16 busts only on burst boundaries. AHB requires that double word width burst be addressed aligned only to the double-word boundary.<br>1'b1: Start INCRX burst only on burst x-aligned addresses.<br>1'b0: Normal AHB operation; start bursts on any double word boundary.<br>Note: When this function is enabled, the burst is started only when the lowest bits of haddr are:<br>INCR4: haddr[3:0] == 4'b0000<br>INCR8: haddr[4:0] == 5'b00000<br>INCR16: haddr[5:0] == 6'b000000 |
| 4 | RW | 0x1 | host0_incr8_en<br>AHB Burst Type INCR8 Enable<br>Enables the AHB master interface to utilize burst INCR8 when appropriate.<br>1'b1: Use INCR8 when appropriate.<br>1'b0: Do not use INCR8; use other enabled INCRX bursts or unspecified length burst INCR. |
| 3 | RW | 0x1 | host0_incr4_en<br>AHB Burst Type INCR4 Enable<br>Enables the AHB master interface to utilize burst INCR4 when appropriate.<br>1'b1: Use INCR4 when appropriate.<br>1'b0: Do not use INCR4; use other enabled INCRX bursts or unspecified length burst INCR. |
| 2 | RW | 0x1 | host0_incr16_en<br>AHB Burst Type INCR16 Enable<br>Enables the AHB master interface to utilize burst INCR16 when appropriate.<br>1'b1: Use INCR16 when appropriate.<br>1'b0: Do not use INCR16; use other enabled INCRX bursts or unspecified length burst INCR. |
| 1 | RW | 0x0 | host0_hubsetup_min<br>Some FS devices down the hub do not recover properly after a pre-amble packet, directed at other LS device, if the hub setup time is four FS clocks. Four FS clocks just meet the specification. By adding one extra clock, these FS devices are made to work better. This strap selects four or five FS clocks as hub setup time for interoperability with the various devices. It is recommended to tie low, that is, for five FS clocks. |
| 0 | RW | 0x0 | host0_app_start_clk<br>OHCI Clock control signal<br>This is an asynchronous primary input to the host core. When the OHCI clocks are suspended, the system has to assert this signal to start the clocks (12 and 48 MHz). This should be de-asserted after the clocks are started and before the host is suspended again. (Host is suspended means HCFS = SUSPEND or all the OHCI ports are suspended). |

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 14 | RW | 0x0 | usb3otg_host_port_power_control_present<br>This indicates whether the host controller implementation includes port power control.<br>1'b0: Indicates that the port does not have port power switches<br>1'b1: Indicates that the port has port power switches |
| 13:8 | RW | 0x20 | usb3otg_fladj_30mhz_reg<br>HS Jitter Adjustment. Indicates the correction required to accommodate mac3 clock and utmi clock jitter to measure 125 's duration.<br>With fladj_30mhz_reg tied to zero, the high speed 125us micro-frame is counted for 123933ns. You must program the value in terms of high speed bit times in a 30 MHz cycle. The default value that must be driven is 32 (assuming 30 MHz perfect clock).<br>Fladj_30mhz_reg connects to the FLADJ register defined in the xHCI spec in the PCI configuration space. Each count is equal to 16 high speed bit times. By default, when this register is set to 32, it gives a 125us interval.<br>Now, based the clock accuracy you can decrement the count or increment the count to get the 125 us uSOF window. For non-PCI systems, it is recommended that this strap is connected to a register that can be controlled by software. This strap is used in device mode also. If device only mode is implemented, it is recommended to tie this input to 'd32. |

| 1 | RO | 0x0 | usb3otg_pme_generation<br>PME Generation.<br>This signal is used to generate a PME (Power Management Event). When the Run/Stop bit of the USB Command Register is cleared during USB suspend mode, the core cannot generate an event and cannot assert a regular interrupt. In this case, the core asserts a pme_generation signal to report any wakeup condition if pme_en is high.<br>If the system does not support PCI-like PME interface, then it must not clear the Run/Stop bit during USB suspend mode. In this case, the core generates an event and asserts an interrupt when there is any wakeup event. |

Rockchip Confidential

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 0 | RO | 0x0 | usb3otg_host_sys_err<br>Host System Error.<br>This signal indicates that a Host System Error has occurred as reflected in the USBSTS.HSE field. This signal is asserted only if the USBCMD.HSEE field is set to '1'. It can occur when the host controller encounters an 'Error' response in the AHB, the AXI, or the Native Master Bus. When the USBSTS.HSE field is cleared by software, this signal is de-asserted unless the master continues to assert its bus error output. The typical software response to an HSE is to reset the core. For more details, refer to section 4.10.2.6 of the xHCI 1.0 specification. |

# 6.18 CSIDPHY_GRF Register Description

There are two CSIDPHY_GRF modules in RK3588.They have different base address.

## 6.18.1 Registers Summary

| Name | Offset | Size | Reset Value | Description |
|---|---|---|---|---|
| CSIDPHY_GRF_CON0 | 0x0000 | W | 0x00000000 | CSIDPHY Control Register |
| CSIDPHY_GRF_STATUS0 | 0x0080 | W | 0x00000000 | CSIDPHY Status Register |

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

## 6.18.2 Detail Registers Description

**CSIDPHY_GRF_CON0**

Address: Operational Base + offset (0x0000)

| Bit | Attr | Reset Value | Description |

## 6.19.2 Detail Registers Description

**PCIe3PHY_GRF_CMN_CON0**

Address: Operational Base + offset (0x0000)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:14 | RO | 0x0 | reserved |
| 13 | RW | 0x1 | link_num_ctrl_mode<br>Link number assignment method<br>1'b0: Overwrite by PHY GRF<br>1'b1: Auto generation by hardware<br>Reserved for RK3588 |
| 12 | RW | 0x1 | pipe_rx_recal_cont_en<br>This pin enables re-locking when alignment is lost in non-8B10 mode. Default value is 1; it is recommended that you control this signal in your SoC via register. |
| 11:9 | RO | 0x0 | reserved |
| 8 | RW | 0x0 | pcie30_clamp_n<br>PMA output clamp for PCS.<br>If the PHY analog power is not present, it should be clamp.<br>1'b0: Clamp enable<br>1'b1: Clamp release |
| 7:3 | RO | 0x00 | reserved |

Rockchip Confidential

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 2:0 | RW | 0x4 | pcie30_phy_mode<br>PCIe30 PHY mode.<br>pcie30_phy_mode[2].<br>The PHY0 and PHY1 aggregation as 1 link when this bit set to 1'b1, and the pcie30_phy_mode[1:0] become invalid. When aggregation is enabled, the 4L controller is integrated as a X4 link controller. If this bit is set to 1'b0, the usage of PHY0 and PHY1 depends on pcie30_phy_mode[1:0].<br>1'b0: Aggregation disable<br>1'b1: Aggregation enable<br><br>pcie30_phy_mode[1].<br>The PHY1 bifurcation enable control, only valid when pcie30_phy_mode[2] is set to 1'b0. If this bit set to 1'b1 the PHY1 (lane 2 and lane3) can work as two links, and the two link PMA share the common analog and reference clock for PHY1. When bifurcation is disable, the 2L controller is integrated with PHY1 as a X2 link. When bifurcation is enabled, the 2L controller connects to lane2 and 1L1 controller connects to lane3 (The pcie1l1_sel in PD PHP GRF should set to 1'b1).<br>1'b0: Bifurcation disable<br>1'b1: Bifurcation enable<br><br>pcie30_phy_mode[0].<br>The PHY0 bifurcation enable control, only valid when pcie30_phy_mode[2] is set to 1'b0. If this bit set to 1'b1 the PHY0 (lane 0 and lane1) can work as two links, and the two link PMA share the common analog and reference clock for PHY0. When bifurcation is disable, the 4L controller is integrated with PHY0 as a X2 link. When bifurcation is enabled, the 4L controller connects to lane0 and 1L0 controller connects to lane1 (The pcie1l0_sel in PD PHP GRF should set to 1'b1).<br>1'b0: Bifurcation disable<br>1'b1: Bifurcation enable |

**PCIe3PHY_GRF_CMN_CON1**

Address: Operational Base + offset (0x0004)

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:0 | RW | 0x0001 | upcs_pipe_config<br>PCS PIPE configuration.<br>When upcs_pipe_config[0] is set to 1, the PCS ignores lane-off via PIPE specification method (TxElecIdle = 1 and TxCompliance = 1) and responds to power-down/rate/width changes. Otherwise, until the MAC de-assert the "turned off" signaling, the PCS ignores any commands to change power-down/rate/width after being turned off. |

**PCIe3PHY_GRF_CMN_CON2**

Address: Operational Base + offset (0x0008)

Rockchip Confidential

| Bit | Attr | Reset Value | Description |
|---|---|---|---|
| 31:16 | WO | 0x0000 | write_enable<br>Write enable for lower 16bits, each bit is individual.<br>1'b0: Write access disable<br>1'b1: Write access enable |
| 15:4 | RO | 0x000 | reserved |
| 3 | RW | 0x0 | ext_pclk_req<br>I External PCLK request.<br>When asserted, the MPLL clock sources in the PHY are powered up and pcs_laneX_pclk outputs stay active, regardless of the pcs_laneX_powerdown[3:0] inputs. |
| 2 | RW | 0x0 | phy_rtune_req<br>Resistor tune request.<br>Assertion of it triggers a resistor tune request to PHYN. |
| 1 | RW | 0x0 | phy_ext_ctrl_sel<br>phy_ext_ctrl_sel is PHY configuration setting per-protocol.<br>External overrides for the per-protocol settings of the PHY configuration inputs. (For per-protocol settings to configure the PHY, refer to the PHY Databook, "PHY Usage and Configuration" chapter).<br>The PCS 3.0 internally determines the hard-coded optimal settings for each protocol. However, these settings can be overwritten on a per-protocol basis from these top-level pins when phy_ext_ctrl_sel input is asserted. The protocolP signals correspond to the pcs_laneX_protocol[1:0] value of 00, 01, 10, respectively.<br>Note: Because protocol1 supports only two rates, protocol1_ext_*_g3 inputs are not provided. |
| 0 | RW | 0x1 | upcs_pwr_stable<br>Power stable to PCS.<br>Status signal indicating that power for the PCS is stable.<br>For information about power gating, see "Power Gating Support" section. TIE to 1. |
